# Talk Highlights

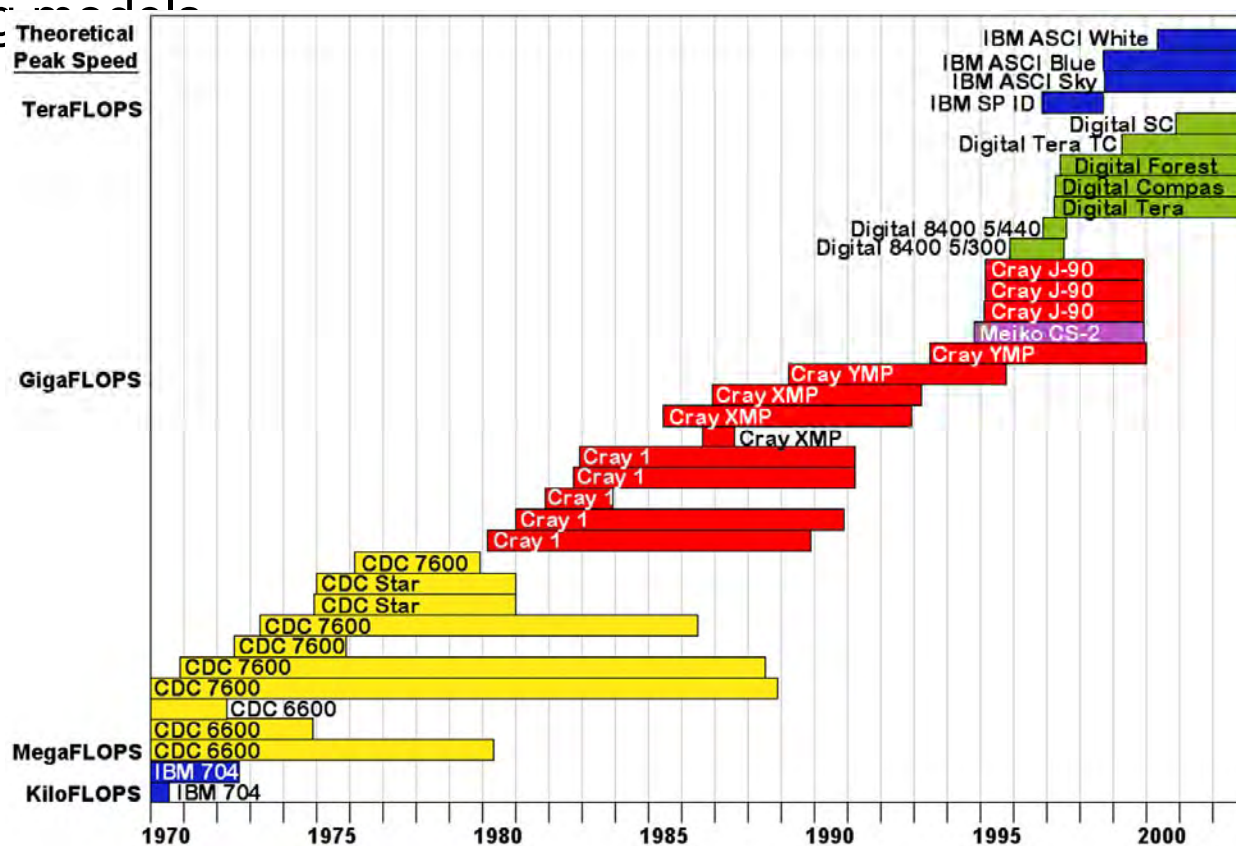

---

- ➔ Significant trends emerging in HPC
  - Architectural complexity: multicore, heterogeneity, power mgt
  - Scale
  - Application complexity: multiphase, multiscale, multiresolution
- ➔ Taken together, these trends can create a widening gap between expected and realized performance
- ➔ Performance engineering is critical to address this gap
  - Measurement
  - Prediction
  - Optimization
- ➔ Some performance engineering solutions that help to close this gap
  - Engagement
    - Frequent interaction between applications teams and performance experts
  - Tools
    - Instrumentation, collection, and analysis tools for measurement
  - Automatic optimization
    - Static and dynamic optimization of applications and libraries
    - Integrate of performance engineering into application/system lifecycle
  - Feedback to architects and system software designers

# Years of Prosperity

- ➔ Increasing large-scale parallelism
- ➔ Increasing number of transistors
- ➔ Increasing clock speed
- ➔ Stable programming models and languages

LLNL System Lifetimes. M. McCoy

# 'New' constraints for architectures

---

- ➔ Power
- ➔ Heat / thermal envelope
- ➔ Signaling
- ➔ Packaging
- ➔ Instruction level parallelism
- ➔ Memory, I/O, interconnect latency and bandwidth
- ➔ Market trends favor 'good enough' computing – *Economist*

**Intel's CTO: "Pentium PC May Need the Power of a Nuclear Reactor"**

Computer Chips to be Hotter than the Sun?

by [Anton Shilov](#)  
02/20/2004 10:27 PM

Heat dissipation of the latest Intel processors, such as high end Pentium 4 and Pentium 4 E, has become a widely discussed issue. Reasons and consequences of astonishingly high thermal levels Intel's chips achieve is probably something the industry is looking at pretty thoroughly, as the general trend for semiconductors' evolution is increase of heat dissipation, which rises necessity of cooling the chips down that also a problem itself. Intel seems to understand the difficulty very well, as the company's Chief Technology Officer Patrick Gelsinger talked on the matter during IDF show.

# Architectural Complexity – Multicore

AMD quad-core due on Sept 10

- ➔ 4 cores
- ➔ Enhanced FPUs
- ➔ Shared resources
  - L3 cache
  - Hypertransport links
  - Memory controllers
- ➔ Independent clock frequencies

# Architectural Complexity – Multicore

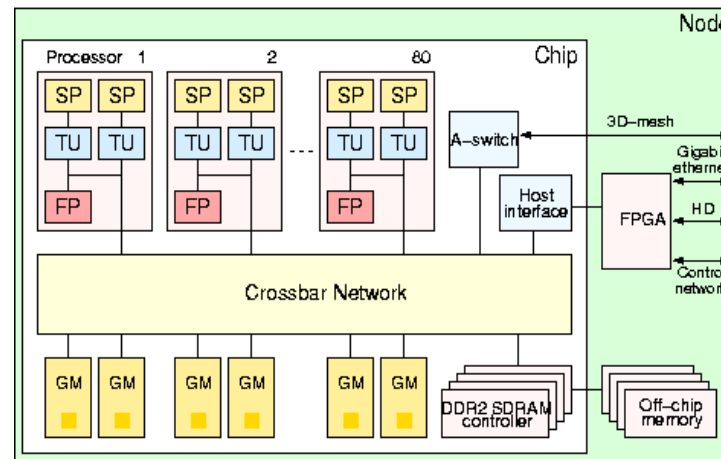

Core count is easy to increase. Resource contention is a challenge!

---

1024...

160...

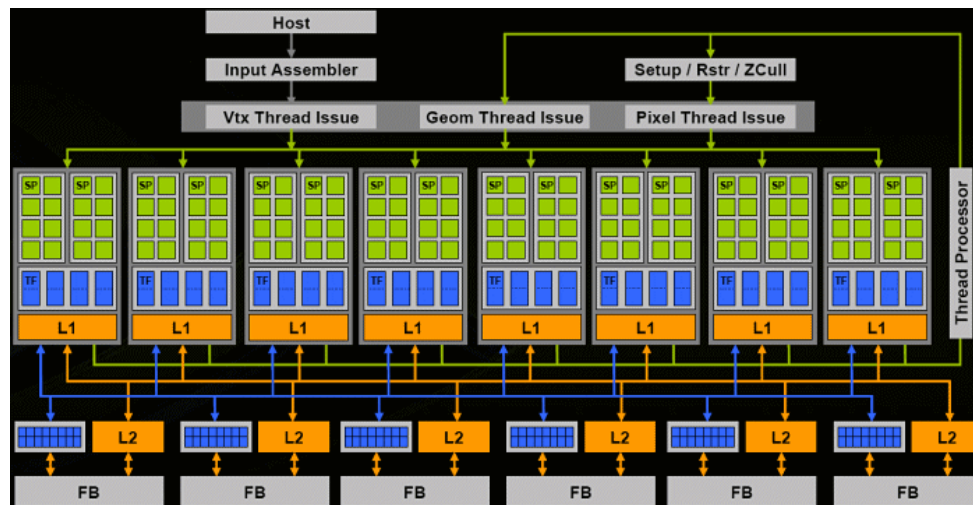

80...

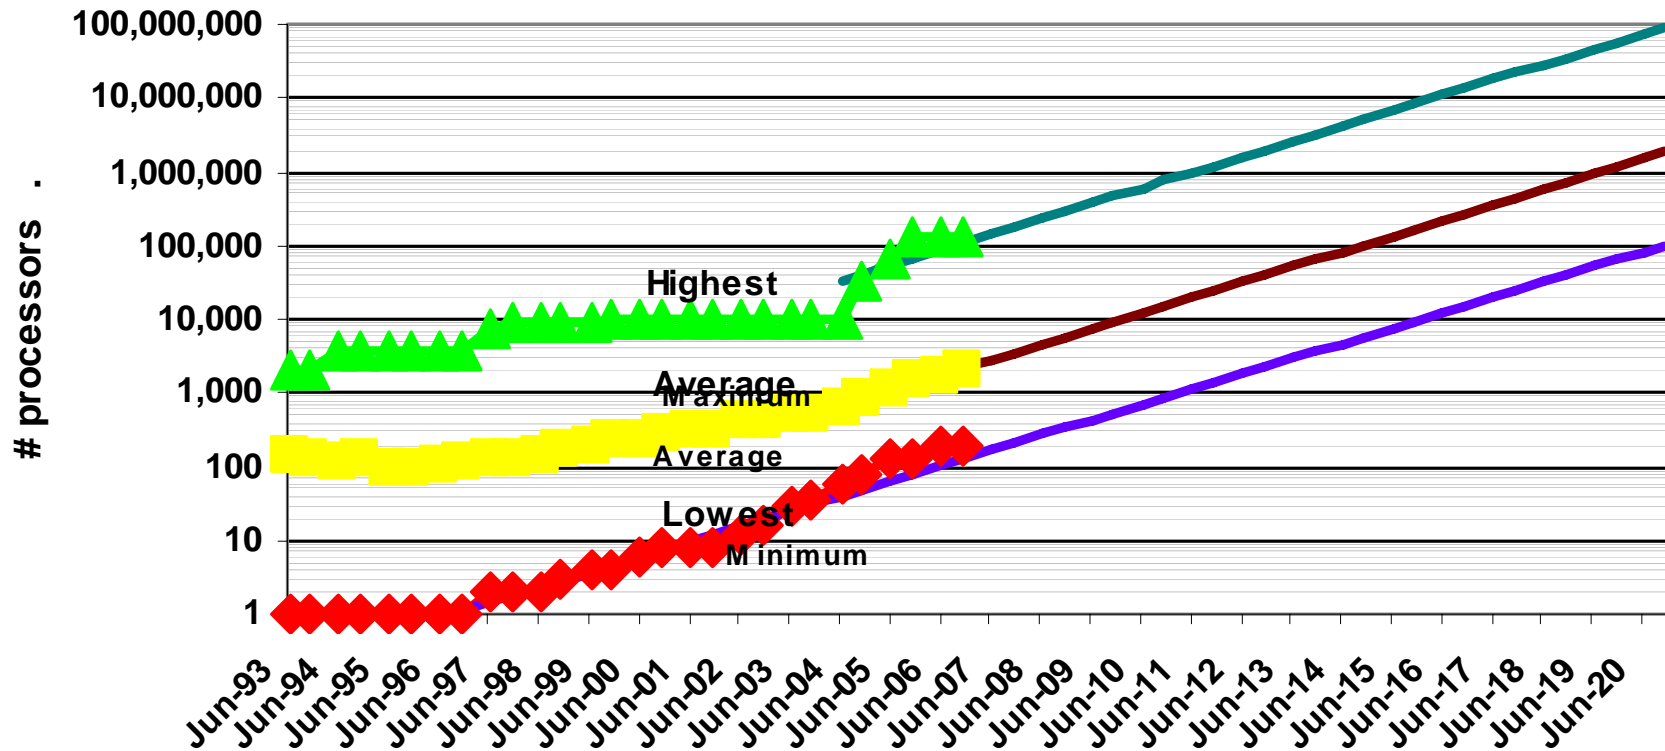

# Architectural Complexity – Heterogeneity, Specialization

Architectures target specific workloads: games, graphics, business, encryption, media

# System Scale

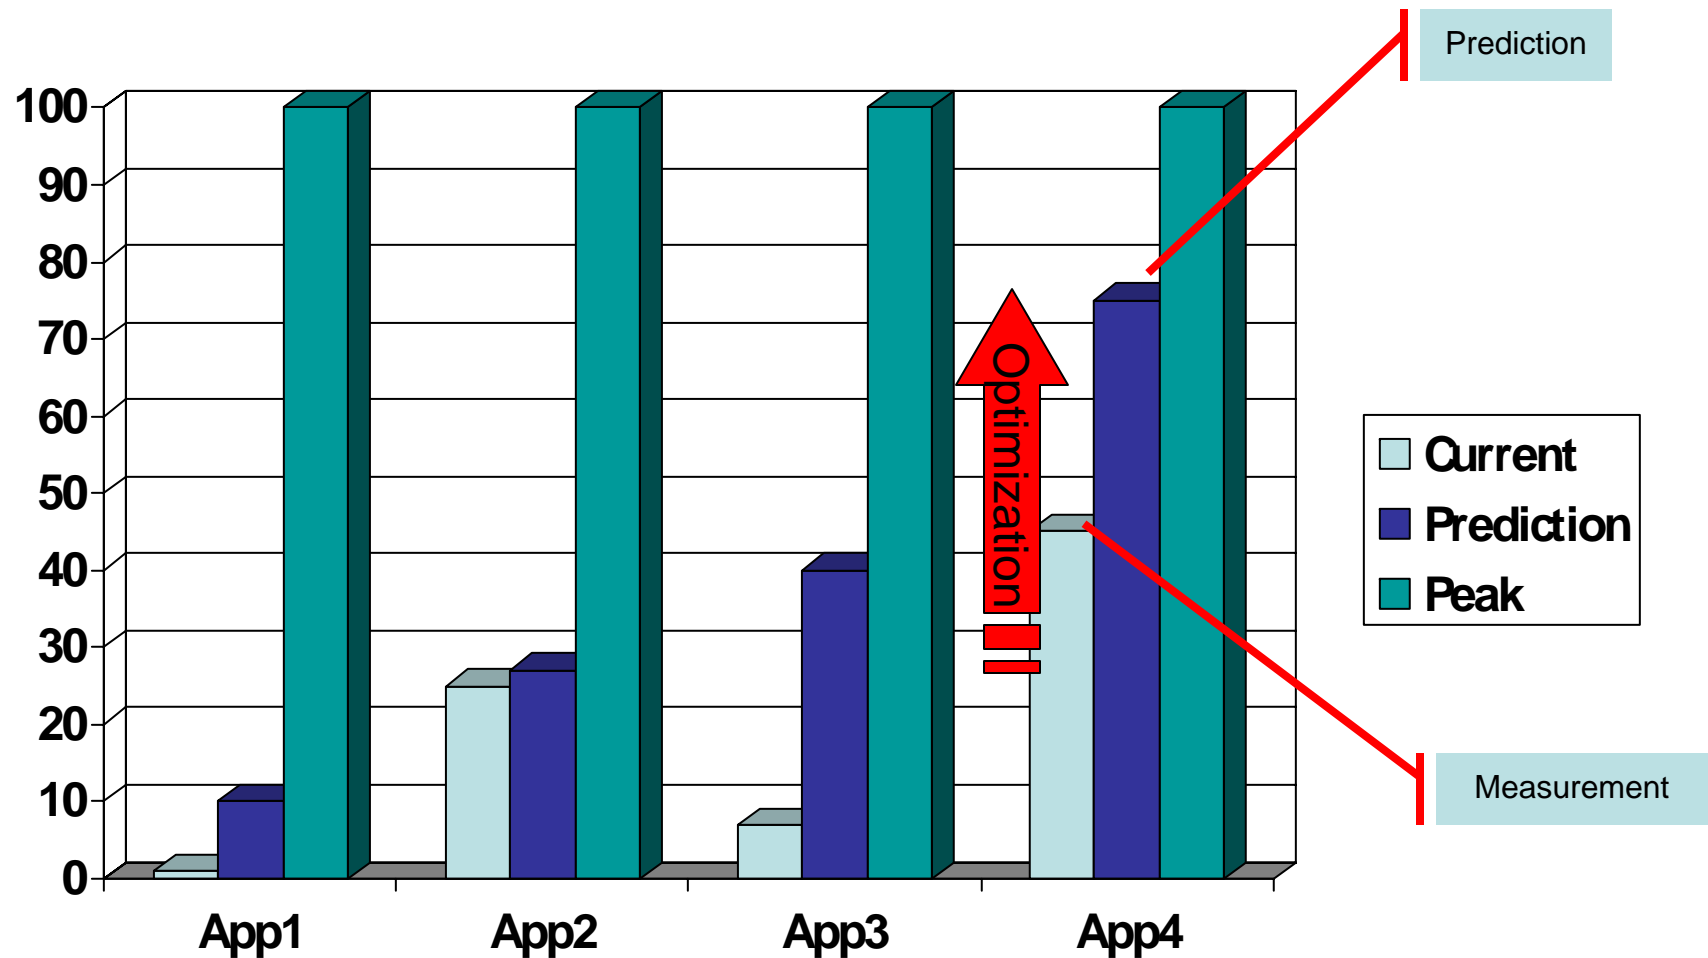

## Interconnect design and cost limits system scale

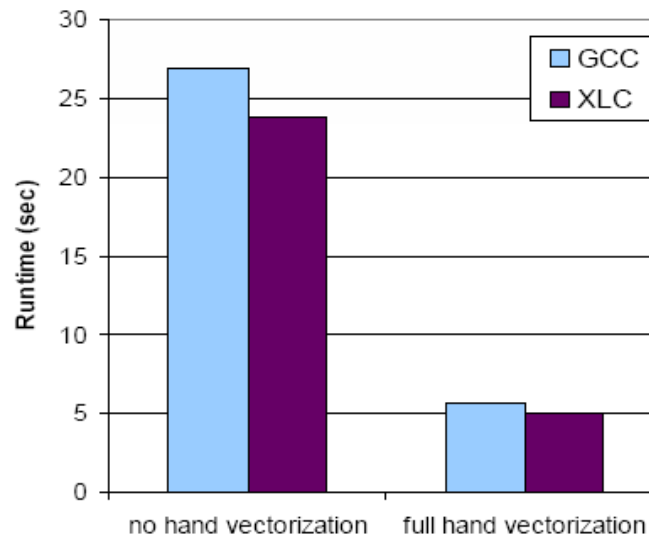

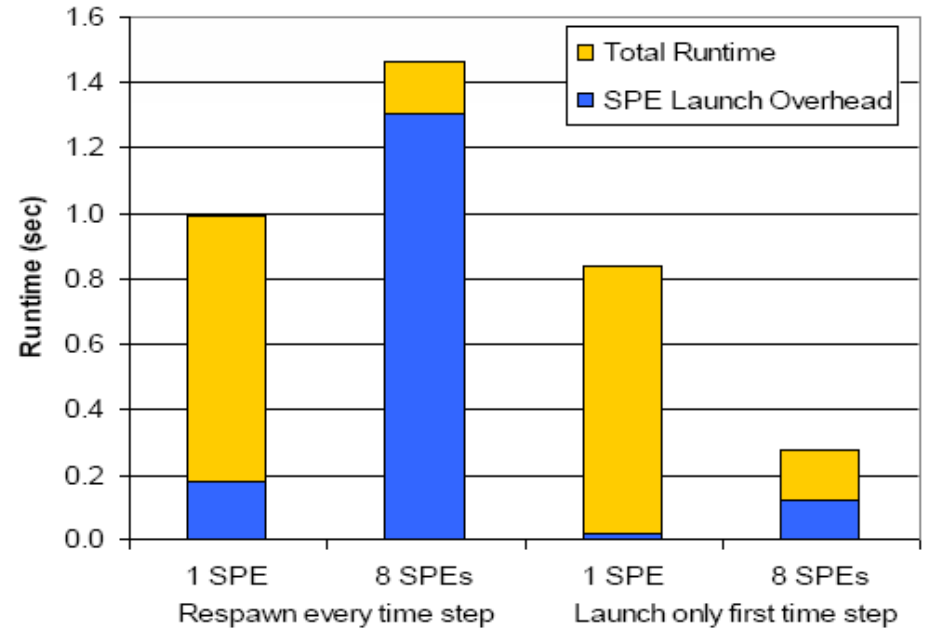

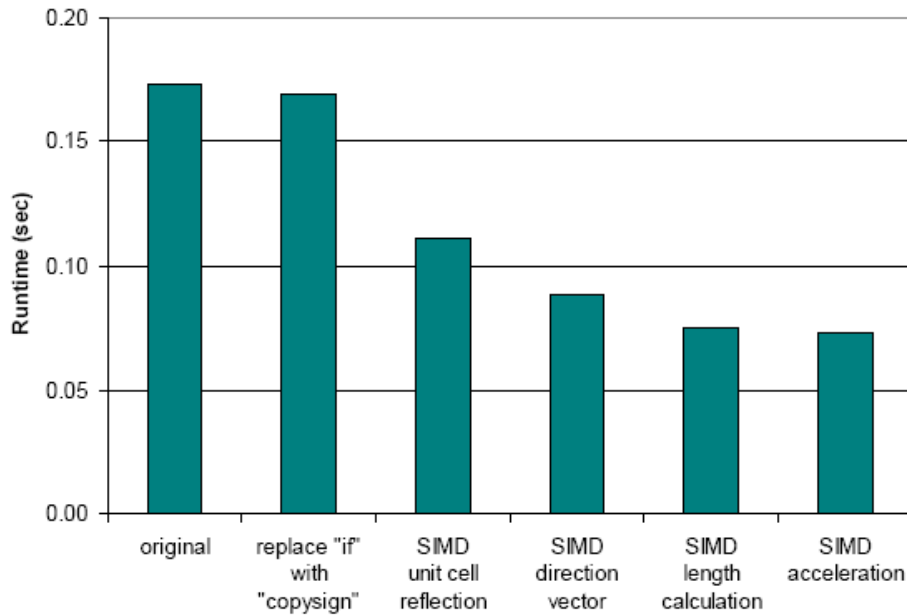

# Performance Engineering encompasses Measurement, Prediction, and Optimization

---

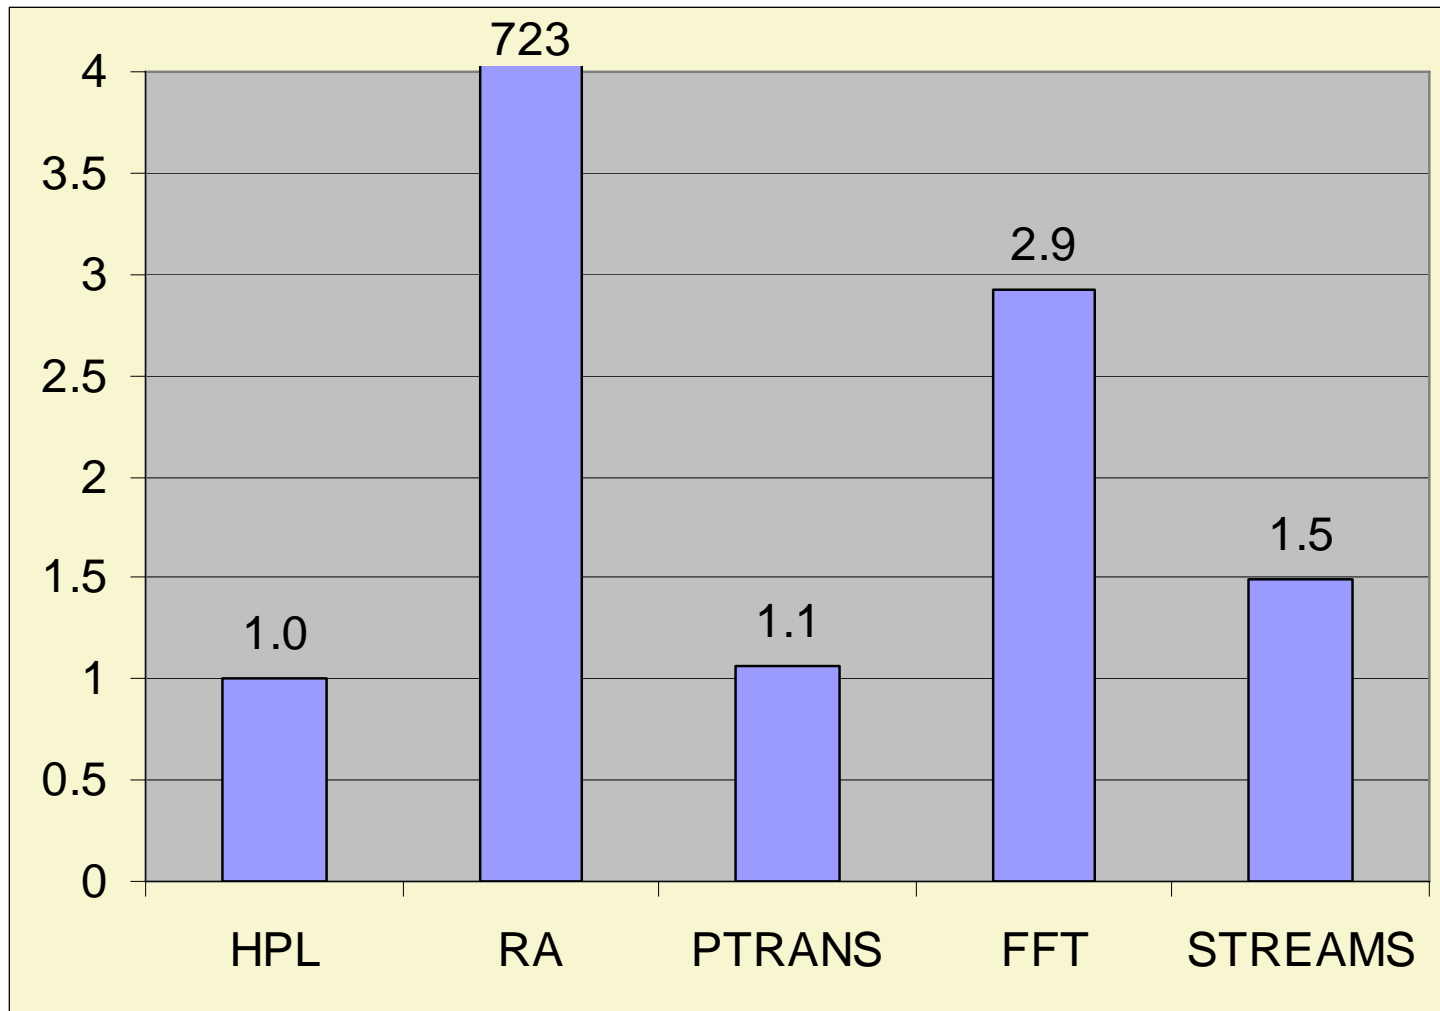

# STI Cell Demonstrates these Sensitivities

## GPUs, FPGAs, and other devices are similar

# HPC Challenge Benchmarks Demonstrate these Issues

~~HPCC on Cray X1 – Baseline v. Optimized~~

# Application Diversity

---

- ➔ Multi-phase, multi-scale applications present challenges in performance engineering
  - Multiple languages
  - Multiple phases of physics, chemistry
  - Adaptive meshing, multigrid solvers, etc
  
- ➔ Applications teams know this best!

# Application Diversity

Dwarfs illustrate some dimensions of this diversity

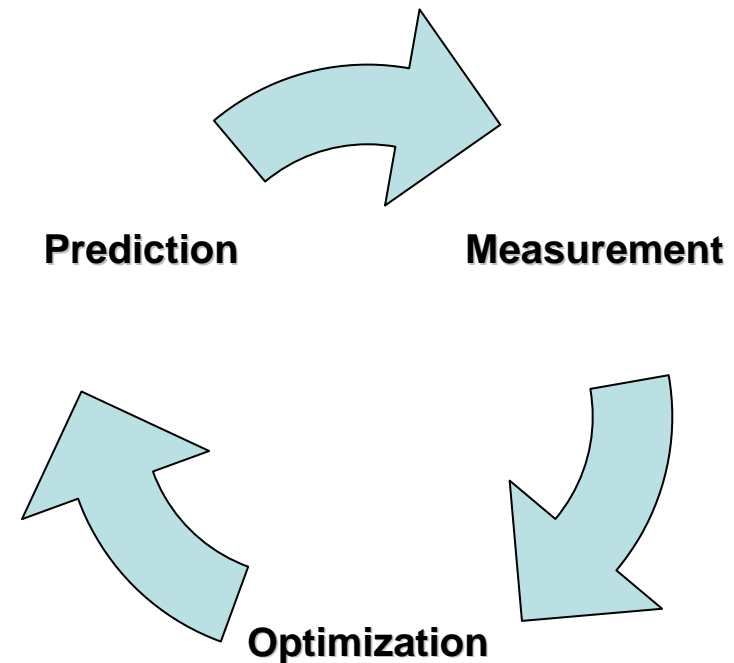

| <b>Science Domain</b> | <b>Code</b> | <b>Structured Grids</b> | <b>Unstructured Grids</b> | <b>FFT</b> | <b>Dense Linear Algebra</b> | <b>Sparse Linear Algebra</b> | <b>Particles</b> | <b>Monte Carlo</b> |

# Observations

---

- ➔ Take together, these three trends have the potential for creating a widening gap between expected and realized performance
- ➔ Performance engineering is critical to address this gap
  - Measurement
  - Prediction
  - Optimization
- ➔ We must feed this information back to architects and system software designers

# Some Performance Engineering Solutions

---

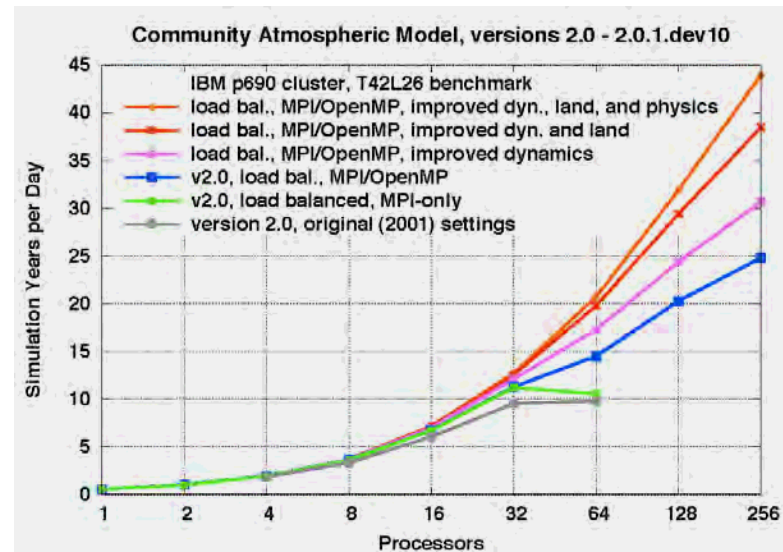

- ➔ Engagement
  - Frequent interaction between applications teams and performance experts
- ➔ Tools
  - Instrumentation, collection, and analysis tools for measurement
- ➔ Automatic optimization
  - Static and dynamic optimization of applications and libraries
  - Integrate of performance engineering into application/system lifecycle
- ➔ Feedback to architects and system software designers

# Engagement: SciDAC PERI

- ➔ Application Engagement
  - Work directly with DOE computational scientists
  - Ensure successful performance porting of scientific software
  - Focus PERI research on real problems
- ➔ Application Liaisons
  - Build long-term personal relationships with PERI researchers and scientific code teams
- ➔ Tiger Teams
  - Focus on DOE's highest priorities
    - SciDAC-2
    - INCITE

Optimizing arithmetic kernels

Maximizing scientific throughput

See [www.peri-scidac.org](http://www.peri-scidac.org) for more info.

# Tools: Software Development Tools for Petascale Computing

---

- ➔ Assembled ~60 experts in software development tools to identify challenges for Petascale
- ➔ See Fred Johnson's presentation

**SOFTWARE DEVELOPMENT TOOLS FOR PETASCALE COMPUTING WORKSHOP**  
WASHINGTON, DC

**August 1-2, 2007**

|                  |

| Contacts         |

**Software Development Tools for PetaScale Computing Workshop**

Petascale computing systems will soon be available to DOE science community. To prepare for the deployment and productive use of these platforms, DOE must ensure that software development tools, such as performance analyzers and debuggers, surpass application requirements for scalability, functionality, reliability, and easy of use. In this workshop, we will assemble experts in the area of software development tools for high performance computing in order to identify and prioritize these opportunities and gaps.

Attendance is by invitation only.

# Tools: Traditional Performance Analysis of Communication Operations

- ➔ Many MPI tools use tracing
  - Produces very detailed information about communication activity
  - Illustrates dependencies among tasks

# Tools: Timeline with 1024 tasks

# Tools: Automatic Classification for Communication Performance Analysis

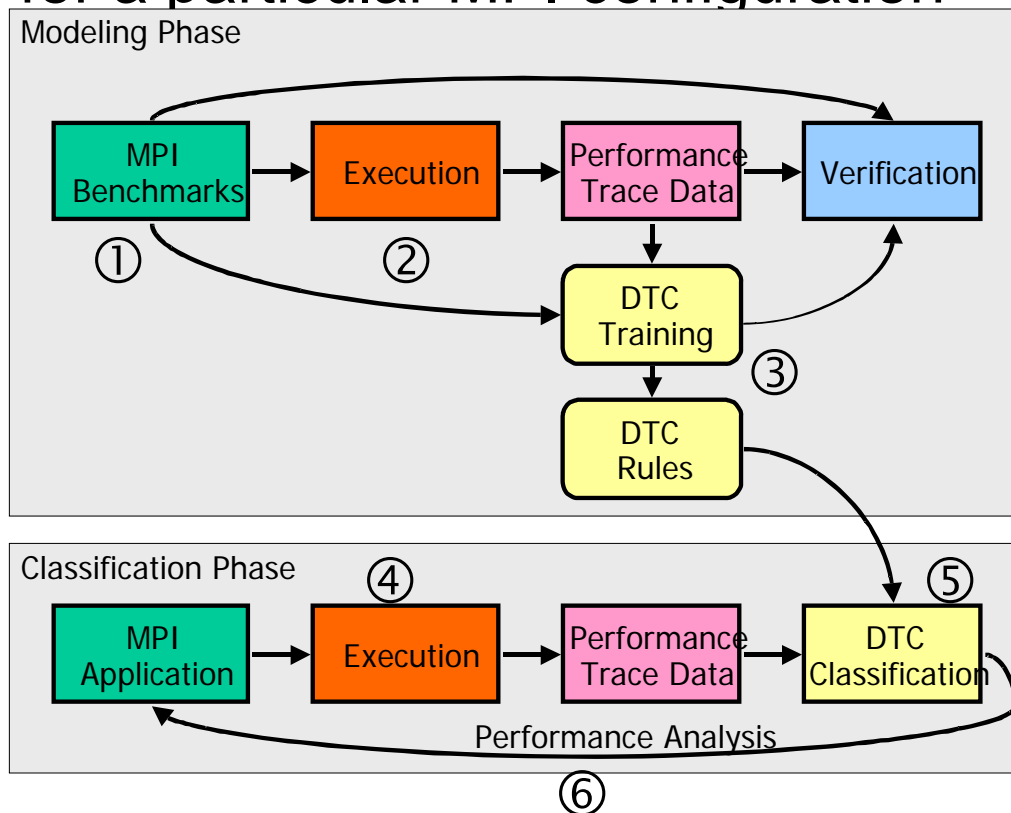

- ➔ Use decision tree classification (a supervised learning technique) to classify application's messages automatically
- ➔ Compare an application's message operations to 'normal' communication for a particular MPI configuration

## ➤ Modeling Phase (once)

- Use benchmarks to generate decision tree
- Both efficient and inefficient

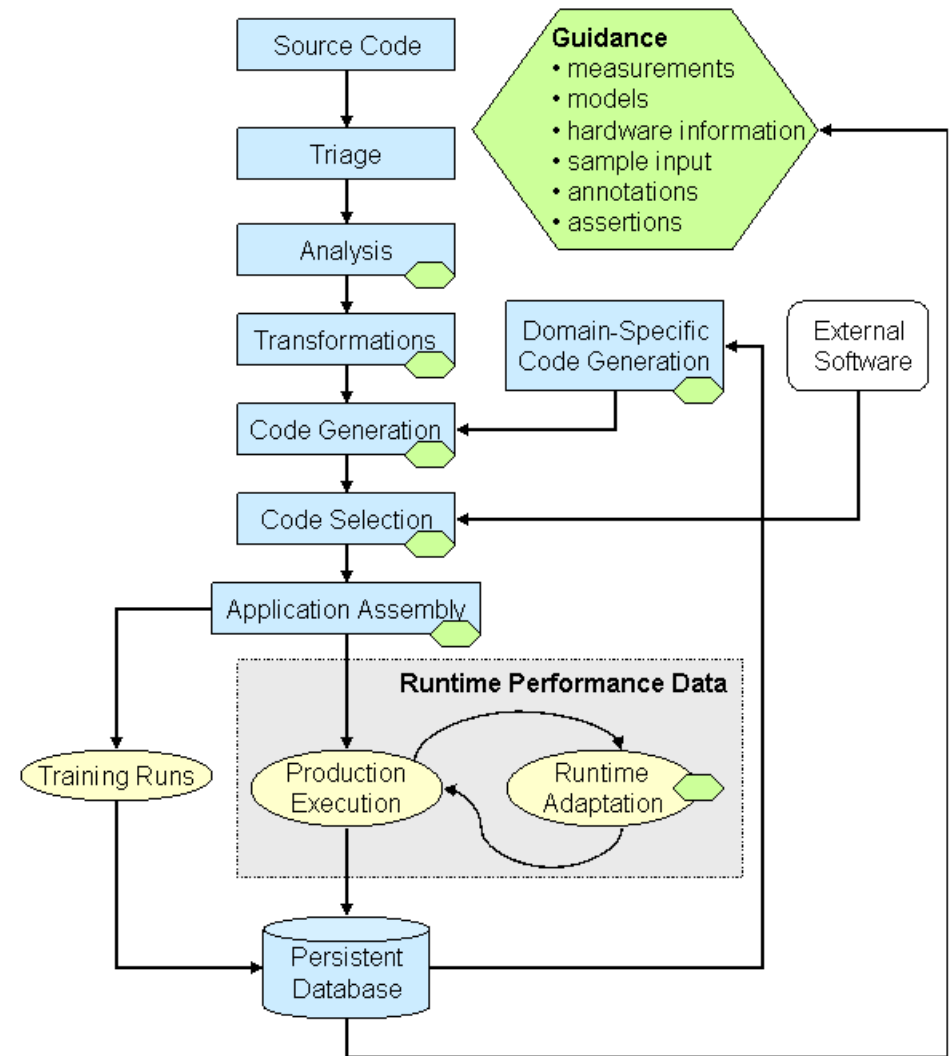

## ➤ Classification Phase (many)

- Execute application
- Analyze application trace with classifier based on decision tree

# Automatic Optimization: SciDAC PERI Framework

- ➔ Long-term goals for PERI
- ➔ Automate the process of tuning software to maximize its performance
- ➔ Build upon forty years of human experience and recent success with libraries
  - PHIPAC, ATLAS, FFTW, SPIRAL, SPOOLES
- ➔ Reduce the performance portability challenge facing computational scientists
- ➔ Address the problem that performance experts are in short supply

**PERI automatic tuning framework**

# Automatic Optimization: Engineering Applications for Performance Throughout their Lifecycle

---

- ➔ Use performance assertions to verify the performance explicitly

```
1:  pa_start(&pa, "$nFlops", PA_AEQ, "11 * %g * %g", &ym, &xm);
2:  for (j=ys; j<ys+ym; j++) {
3:    for (i=xs; i<xs+xm; i++) {
4:      if (i == 0 || j == 0 || i == Mx-1 || j == My-1) {
5:        f[j][i] = x[j][i];
6:      } else {
7:        u      = x[j][i];
8:        uxx   = (two*u - x[j][i-1] - x[j][i+1])*hydhx;
9:        uyy   = (two*u - x[j-1][i] - x[j+1][i])*hxdhy;
10:       f[j][i] = uxx + uyy - sc*PetscExpScalar(u);
11:     }
12:   }
13: }
14: pa_end(pa);
15: PetscLogFlops(11*ym*xm);
```

- ➔ Expression
  - "\$nFlops", PA\_AEQ, "11 \* %g \* %g", &ym, &xm
  - Empirically measure number of floating point operations with instrumentation
  - Test approximate equality ( $\pm 10\%$ ) to '11 \* ym \* xm' ?
- ➔ Empirical measurements verify performance model

# Many Other Performance Engineering Topics...

---

- ➔ Performance prediction
  - Analytical modeling
  - Simulation
  - Hybrid
  - Historical predictions
- ➔ New programming models, languages
- ➔ Reliability, correctness, fault tolerance
- ➔ IO
- ➔ Cooperation with vendors on hardware and software architecture and performance engineering support
- ➔ Etc...

# Summary

---

- ➔ Significant trends emerging in HPC
  - Architectural complexity: multicore, heterogeneity, power mgt
  - Scale
  - Application complexity: multiphase, multiscale, multiresolution
- ➔ Taken together, these trends can create a gap between expected and realized performance
- ➔ Performance engineering is critical to bridging this gap
  - Measurement
  - Prediction
  - Optimization
  - Feedback to architects and system software designers
- ➔ Some performance engineering solutions that help to close this gap
  - Engagement
    - Frequent interaction between applications teams and performance experts
  - Tools
    - Instrumentation, collection, and analysis tools for measurement
  - Automatic optimization
    - Static and dynamic optimization of applications and libraries
    - Integrate of performance engineering into application/system lifecycle
  - Feedback to architects and system software designers
