

Computing and AI for Pandemic Response: Looking Forward

Advances in biological sciences, combined with the accelerating development of computing, data processing, and artificial intelligence (AI), are fueling a new wave of innovation that could have significant impact in sectors across the economy, from healthcare and agriculture to consumer goods and energy – *McKinsey Global Institute May 2020*

The COVID-19 High Performance Computing Consortium

Bringing together the Federal government, industry, and academic leaders to provide access to the world's most powerful high-performance computing resources in support of COVID-19 research.

Projects

Petaflops

Active

Fighting COVID-19 will require extensive research in areas like bioinformatics, epidemiology, and molecular modeling to understand the threat we're facing and to develop strategies to address it.

Here are some of our projects.

Collaborating Initiatives

Consortium collaborating initiatives represent efforts organized regionally around the world that are also working to accelerate research for fighting COVID-19. The Consortium is working with these initiatives and collaborating to share knowledge gained from our respective efforts.

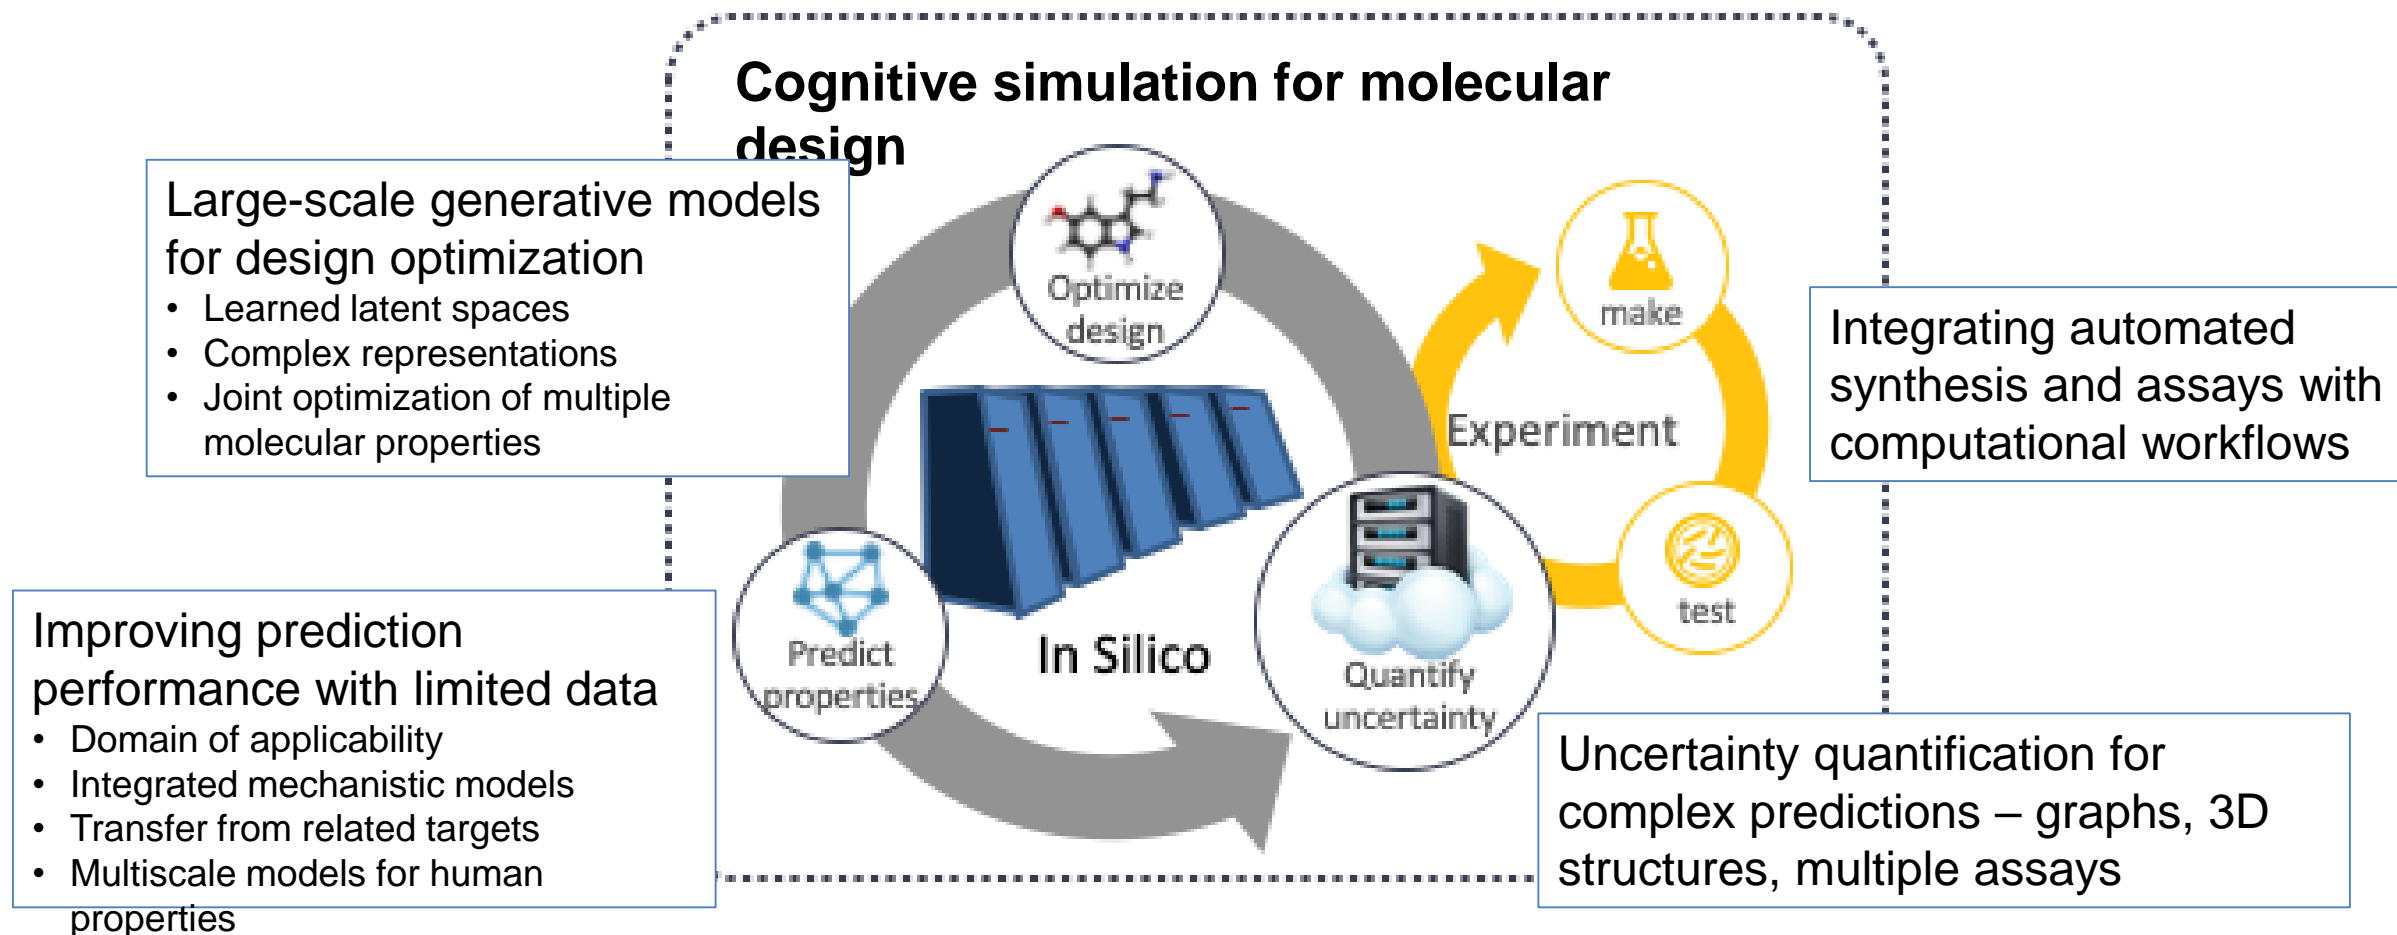

- EU PRACE COVID-19 Initiative
- NCI Australia and Pawsey Supercomputing Centre

AI is being used to integrate increasingly complex simulations and growing but still limited data sets

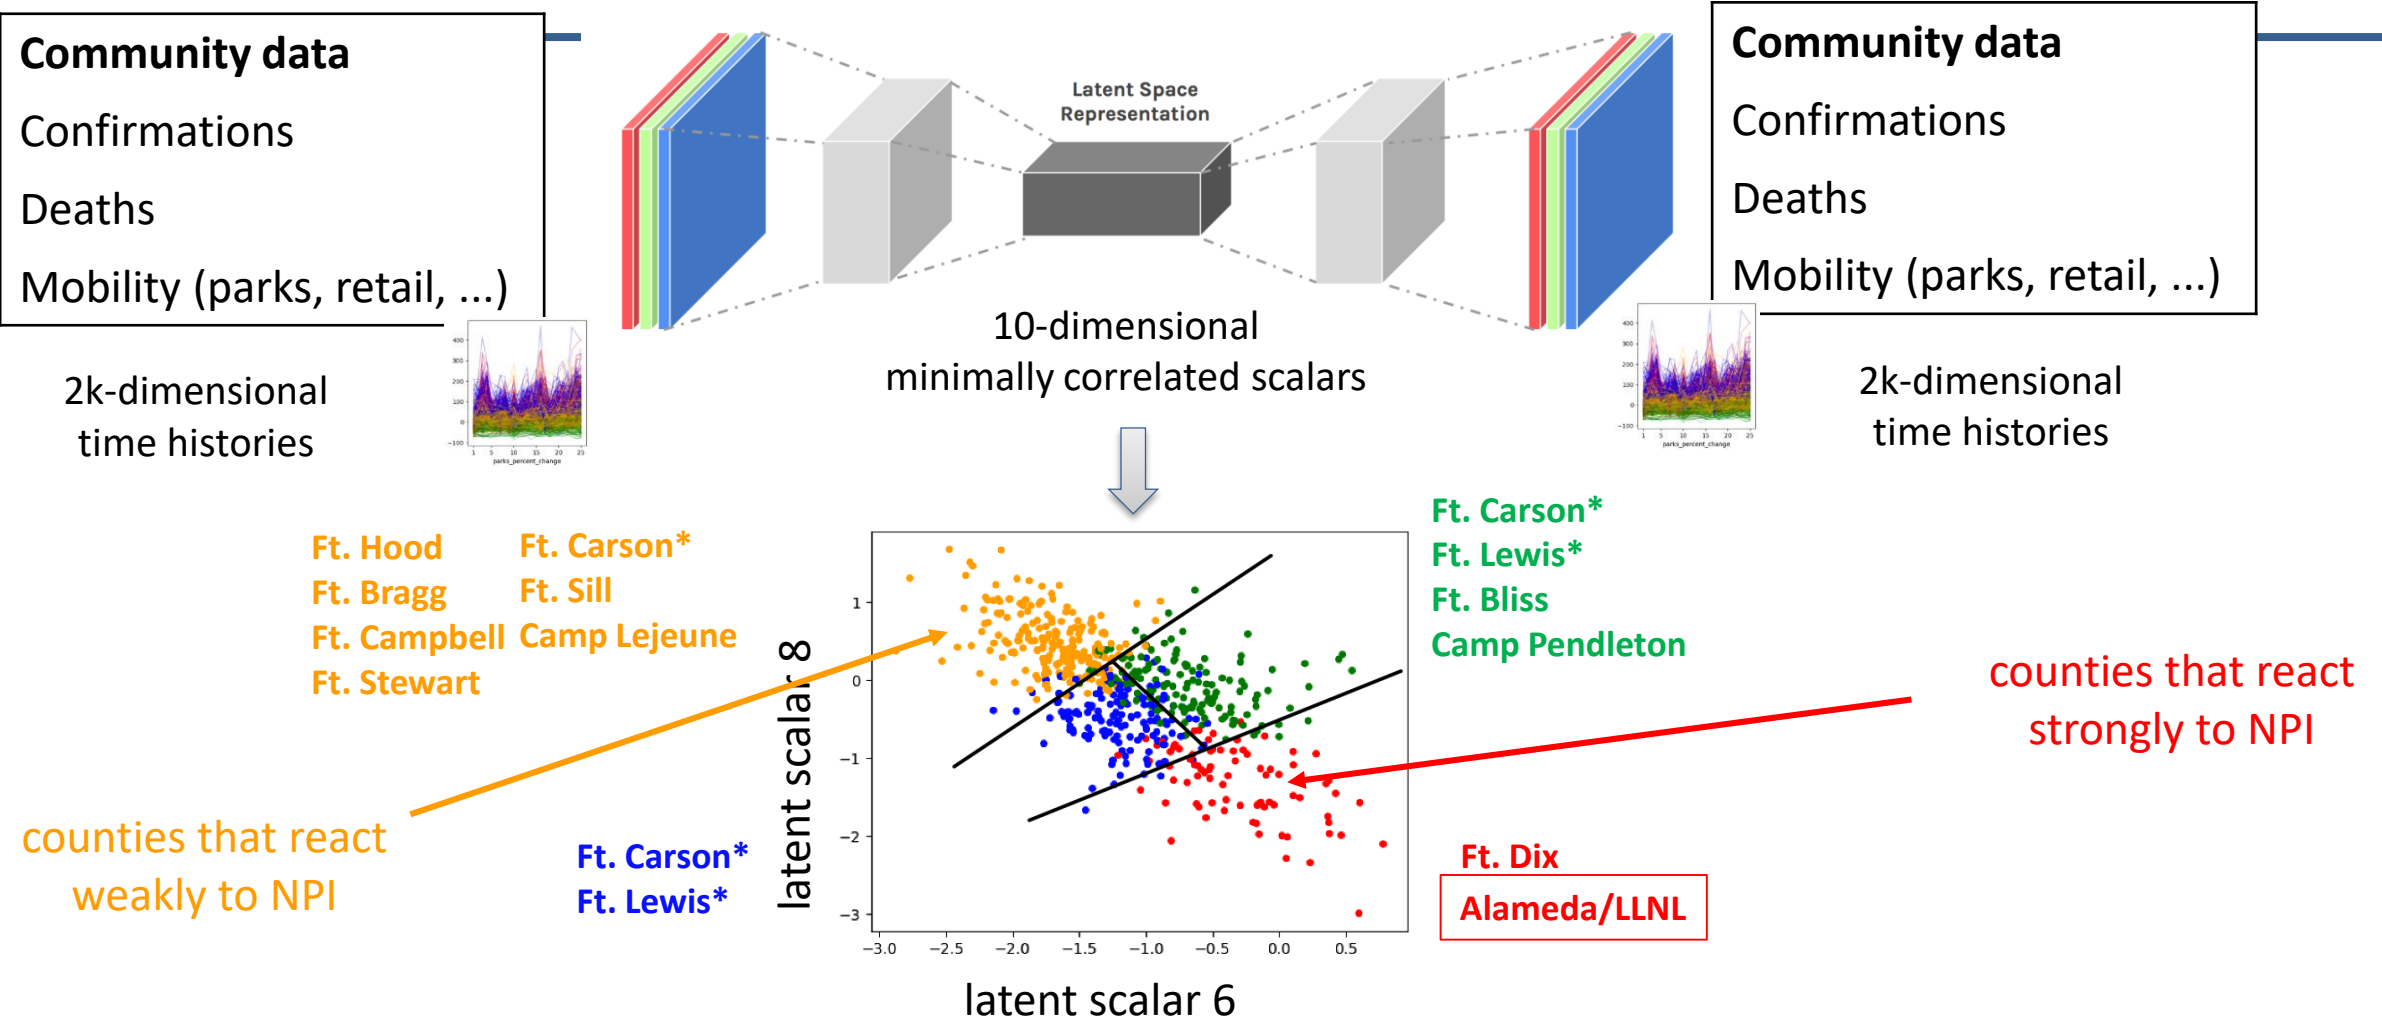

- **Improvement of prediction performance and uncertainty quantification**
- **New machine learning-driven approaches to design**
- **Amplification of our effective computational power**

AI-driven systems for therapeutic acceleration push on the frontiers of machine learning and predictive modeling

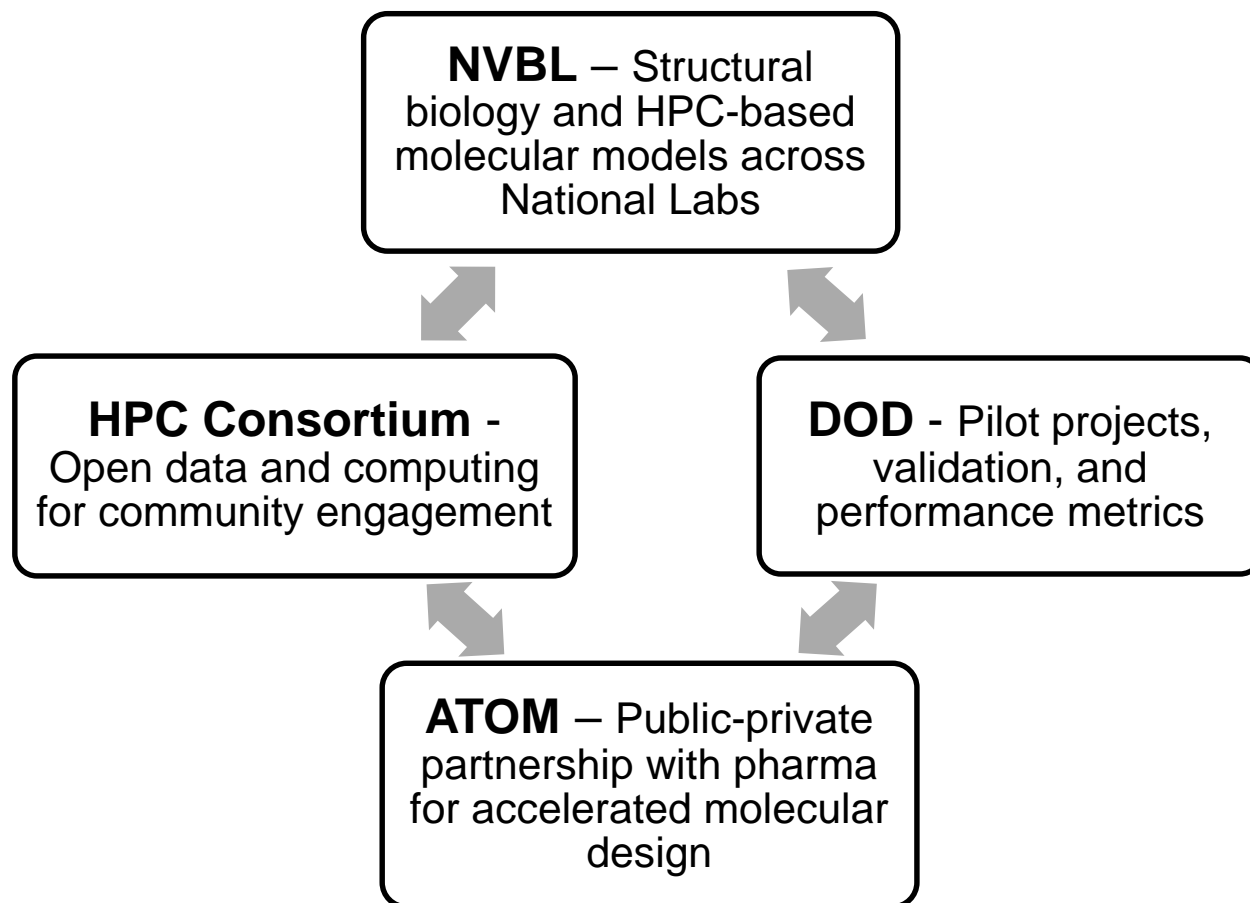

AI-driven CogSim tools can integrate community data to improve understanding of differences in disease spread among counties

What are the implications for key Army platforms?

The nation has an urgent need for new capabilities in accelerated therapeutic development

A new public-private partnership to

1. Pre-position large scale data resources on viral interactions
2. Establish and grow an open predictive modeling R&D community for viral therapeutics
3. Develop the molecular design platform and pre-position probe molecules for interacting with viral proteins
4. Exercise and validate the platform through a sustained program of drug discovery for the public good

Current DOE partnerships provide a strong starting point
