LE Bisping

June 2022

Prepared for
the U.S. Department of Energy
under Contract DE-AC05-76RL01830

Pacific Northwest National Laboratory
Richland, Washington 99352

Summary

The U.S. Department of Energy (DOE) Office of Science (SC) Pacific Northwest National Laboratory (PNNL) Richland Campus facilities with the largest potential for radioactive air emissions are those at the Physical Sciences Facility. Operations conform to the Washington State Department of Health-issued Radioactive Air Emissions License-005.

This report documents radionuclide air emissions that result in the 2021 highest effective dose equivalent (EDE) to an offsite member of the public, referred to as the maximally exposed individual (MEI). The report has been prepared in compliance with the Code of Federal Regulations (CFR), Title 40, Protection of the Environment, Part 61, National Emission Standards for Hazardous Air Pollutants (NESHAP), Subpart H, “National Emission Standards for Emissions of Radionuclides Other than Radon from Department of Energy Facilities” and Washington Administrative Code (WAC) Chapter 246-247, “Radiation Protection–Air Emissions.”

Federal regulations in 40 CFR 61, Subpart H, require the measurement and reporting of radionuclides emitted from DOE facilities and the resulting offsite dose from those emissions. While the regulations are intended for the measurement of point source emissions, they include fugitive emissions with regard to complying with the dose standard. The regulations impose a standard of 10 mrem/yr EDE, which is not to be exceeded. Washington State adopted the 40 CFR 61 standard of 10 mrem/yr EDE in its regulations and reporting of the EDE to the MEI from both point source emissions and any fugitive source emissions of radionuclides. WAC 246-247 further requires the reporting of radionuclide emissions, including radon, from all PNNL Richland Campus sources.

The PNNL Richland Campus MEI dose from routine major and minor point source emissions in 2021 is 1.7E-05 mrem (1.7E-07 millisievert [mSv]) EDE. The MEI dose from all PNNL Richland Campus fugitive sources is 1.2E-06 mrem (1.2E-08 mSv) EDE. The dose from radon emissions is 2.1E-09 mrem (2.1E-11 mSv) EDE. No nonroutine emissions from Campus facilities occurred in 2021. The total radiological dose to the MEI from all PNNL Richland Campus radionuclide emissions in 2021, including fugitive emissions and radon, is 1.8E-05 mrem (1.8E-07 mSv) EDE, or more than 100,000 times less than the federal and state standard of 10 mrem/yr, with which the PNNL Richland Campus is in compliance.

Additionally, sample date corrections are reported for ambient air composite sample records presented in Appendix C of prior CY2019 and CY2020 compliance reports. Records provided by the analytical lab incorrectly reported sample dates. These are essentially editorial corrections because the corrected dates did not impact reported sample or reported average ambient air concentrations.

For further information concerning this report, contact Thomas M. McDermott, DOE Pacific Northwest Site Office, by telephone at (509) 372-4675 or by e-mail at tom.mcdermott@science.doe.gov.

1.0 Introduction

This report documents calendar year (CY) 2021 radionuclide air emissions from the U.S. Department of Energy (DOE) Office of Science (SC) Pacific Northwest National Laboratory (PNNL) Richland Campus (hereafter, PNNL Richland Campus or Campus), and the resulting effective dose equivalent (EDE) to the maximally exposed individual (MEI) member of the public. This document complies with reporting requirements in the Code of Federal Regulations (CFR), Title 40, Protection of the Environment, Part 61, National Emission Standards for Hazardous Air Pollutants, Subpart H (2002), “National Emission Standards for Emissions of Radionuclides Other than Radon from Department of Energy Facilities,” and in Washington Administrative Code (WAC) Chapter 246-247 (2019), “Radiation Protection—Air Emissions.” This report satisfies the annual reporting requirements under the DOE PNNL Richland Campus license, Radioactive Air Emissions License (RAEL)-005, for CY2021 operations.

Richland Campus on-site activities have been reduced since March 2020 due to the COVID-19 pandemic. The 2021 dose from the sampled stack emissions remained slightly below 2019 (pre-pandemic) levels. In contrast, the dose from minor and fugitive sources (unsampled emissions sources) increased. The CY2020 MEI location was not occupied in 2021, so the identified MEI location for CY2021 PNNL emissions was south of that location, as discussed in Section 3.1. The CY2021 MEI dose is similar to that from CY2020.

This report is available online at <https://science.energy.gov/pnso/resources/>.

Battelle Memorial Institute (Battelle) is contracted to operate PNNL for DOE-SC. Battelle manages operations at the PNNL Richland Campus and other leased/occupied research and office areas nearby. Activities at the Richland Campus include research and development in the physical, chemical, life, and environmental sciences, and relevant environmental monitoring.

Additionally, Section 6.0 presents updates to sample dates reported for ambient air composite sample records presented in Appendix C of prior CY2019 and CY2020 compliance reports. These are essentially editorial corrections because the corrected text did not impact reported sample or reported average ambient air concentrations.

1.1 PNNL Richland Campus Description

The PNNL Richland Campus (PNSO 2013) is located in southeastern Washington State (Figure 1.1). It is adjacent to the much larger DOE Hanford Site (Figure 1.2). The Richland Campus occupies 1.2 mi² (3.0 km²) just south of the Hanford Site 300 Area, whereas the Hanford Site occupies about 580 mi² (1,500 km²).

The Campus lies about 170 mi (275 km) east-northeast of Portland, Oregon; 170 mi (270 km) southeast of Seattle, Washington; and 125 mi (200 km) southwest of Spokane, Washington. Operations are permitted under RAEL-005 to perform radiological activities with potential air emissions.

The area south and east of the PNNL Richland Campus is developed with office, laboratory, residential, and retail space. The Columbia River borders the northern PNNL Richland Campus to the east. Environmental conditions of non-operational Hanford Site areas are also characteristic of the Campus. More in-depth discussions on the characteristics of the Hanford Site are available in the Hanford Site National Environmental Policy Act characterization (Duncan et al. 2007).

1.1.1 Historical Background

In December 2003, DOE assigned responsibility to the Pacific Northwest Site Office within DOE-SC to oversee the operation of PNNL, which was established in 1965. Battelle is contracted to DOE to operate PNNL (contract DE-AC06-76RL01830) and has operated PNNL since 1965. The PNNL Richland Campus (orange boundary) includes active emission units in the Physical Sciences Facility (PSF), as identified in Figure 1.1.

Figure 1.1. DOE-SC PNNL Richland Campus Emission Units Locations

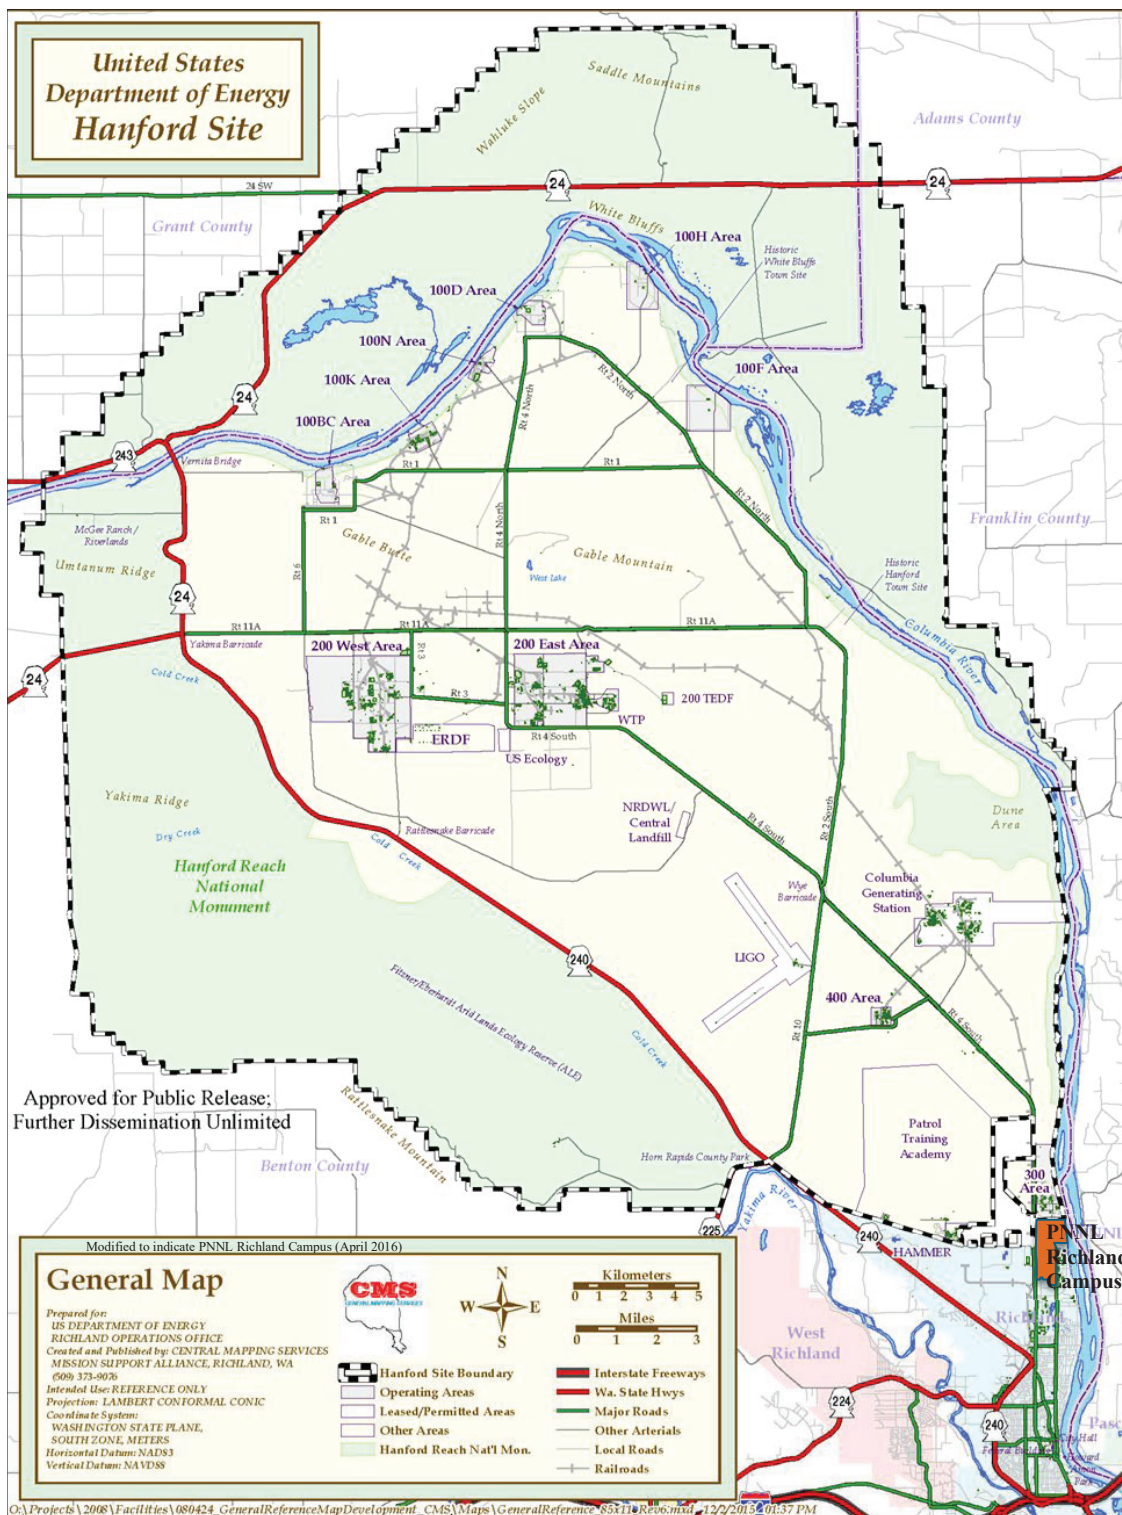

Figure 1.2. Location of the Hanford Site in Relation to the PNNL Richland Campus

The buildings or areas with emission units subject to 40 CFR 61, Subpart H, reporting are listed in Table 1.1. As a group of research buildings, the PSF buildings host changing types of research. Section 1.2.2 provides more detailed descriptions of the buildings with emission units subject to 40 CFR 61, Subpart H (2002), reporting.

The Hanford Site history is briefly described here because of its location adjacent to the PNNL Richland Campus and because it is a source of radiological airborne emissions that could affect the Campus. From the mid-1940s, facilities at the Hanford Site were dedicated to producing plutonium for national defense and to managing the radioactive and chemical wastes generated from those production processes. More recently, major efforts have been underway to clean up contamination in the environment and facilities resulting from past operational practices and the research and development of new and improved waste disposal technologies. The Hanford Site 300 Area, which is closest to the PNNL Richland Campus, contains research and development laboratories and ongoing remediation operations. The two principal DOE Offices that manage programs at the Hanford Site are the Richland Operations Office and the Office of River Protection.

Table 1.1. PNNL Richland Campus Licensed Buildings – 2021

Building	Start Date of DOE-SC Radiological Operations
3410 Building – Materials Sciences and Technology Laboratory	August 2010
3420 Building – Radiation Detection Laboratory	August 2010
3425 Building – Underground Laboratory	October 2010
3430 Building – Ultra-Trace Laboratory	July 2010

1.1.2 PNNL Richland Campus Facilities

Point source emission units are identified as major or minor. Other emissions are identified as a fugitive emission. The identifier for the emission unit considers whether radiological emissions are expected to expose a member of the public to a potential dose greater or less than 0.1 millirem per year (mrem/yr). A point source is designated *major* when hypothetically, in the absence of all abatement-control equipment, its potential maximum emissions can cause a dose greater than 0.1 mrem/yr (0.001 mSv/yr) EDE¹ to the nearest member of the public not employed by DOE or its contractors associated with the PNNL Richland Campus and who lives near and/or has unrestricted access to a place of employment on the Campus. A point source is *minor* when under the same conditions its potential maximum emissions in the absence of all abatement-control equipment cannot cause a dose greater than 0.1 mrem/yr EDE. A source could be characterized as a fugitive emission if a potential source of radioactive material is not actively monitored or ventilated at the point of release.² Fugitive sources of radionuclide emissions are generally those that are not actively ventilated, not sealed to prevent the escape of volatile or resuspended radioactive material to the ambient air, and not as amenable to controlled routine sampling, as is done with stacks. Potential unabated emissions from Campus fugitive source locations would be expected to have an extremely small dose impact, even under worst-case release conditions.

Activity and dose information is generally reported to two significant digits. An annual dose rate of less than 1.0E-04 mrem/yr (1.0E-06 mSv/yr) is very low and may be rounded to one significant digit (e.g., 3.9E-05 mrem would be rounded to 4E-05 mrem [4E-07mSv]). More significant digits may be reported if they provide informative resolution or if the value is significantly larger than most of the other values reported with it (e.g., a 5.9723E+01 Ci K-40 emission from one source and 2.4E-03 Ci K-40 emission from another). Reported totals may be slightly different from the sum of individual values in the text because the individual text values are rounded whereas the reported total uses additional, unreported, significant digits in the summed individual value.

¹ CAP88-PC Version 4.0, used for dose modeling, indicates dose as mrem/yr EDE in output files.

² Section 4.0 provides a more detailed discussion of fugitive emissions.

Types of emission units under the license include both major and minor emission units as well as fugitive emissions. Fugitive emissions also include Potential Impact Category (PIC)-5 permits for Campus-wide operations (Table 1.2; Figure 1.3 and Figure 1.1). PIC-5 emissions are very low potential-to-emit activities that are permitted under the license and conform to PNNL operational controls; emissions are conservatively reported as the permit maximum (Barnett 2018).

Table 1.2. Types of Emission Units under the DOE PNNL Richland Campus License – 2021

Facility/Building ID	Building Name or Campus-wide Permit Name	Emission Unit Type(s)
PSF/3410	Materials Sciences and Technology Laboratory	Major
PSF/3420	Radiation Detection Laboratory	Major and Minor
PSF/3425	Underground Laboratory	Fugitive
PSF/3430	Ultra-Trace Laboratory	Major and Minor
Campus	Volumetrically Released Radioactive Material (VRRM; PIC-5)	Fugitive
	Non-dispersible Radioactive Material (NDRM; PIC-5)	Fugitive
	Facilities Restoration (PIC-5)	Fugitive
	Sources for Instrument/Operational Checks (SIOC; PIC-5) ^(a)	Fugitive

(a) Name reflects RAEL-005 nomenclature; historically referred to as Low-level Sources (LLS) PIC-5 emission unit.

Figure 1.3. PNNL Richland Campus Physical Sciences Facility (PSF) with Buildings Identified

1.1.3 Facilities Adjacent to the PNNL Richland Campus

Land adjacent to the PNNL Richland Campus is occupied by the Hanford Site (Figure 1.2), office and research facilities, and a smaller number of local businesses (e.g., restaurants, offices). Just north of the Campus, the Hanford Site 300 Area hosts radiological operations. The current Hanford Site 300 Area activities include cleanup, research, and office support functions. Radiological emissions from the Hanford Site are described in the Hanford Site Radionuclide Air Emissions Report (Dyekman et al. 2022).

In addition to the Hanford Site, some privately and publicly owned facilities capable of generating airborne radionuclide emissions are located adjacent to or near the PNNL Richland Campus. These

facilities include those that are on the Hanford Site but are not part of DOE operations: 1) a low-level waste burial site on the Hanford Site 200 Area plateau and 2) a commercial nuclear power reactor and associated buildings near the Columbia River, north of the Hanford Site 300 Area. In addition, nearby facilities include a tritium radiolabeling service south of the Campus, a commercial nuclear reactor fuel fabrication facility, and a waste treatment business west of the Campus, and a nuclear power plant commercial laundry service southwest of the Campus. These facilities are discussed in this report to the extent necessary. Emissions from these facilities are not included in this report because they are regulated separately from the PNNL Richland Campus.

1.2 Point Source Descriptions

This section describes point sources that emit or have the potential to emit radionuclides at the Campus. A point source is reported in this document if it met the following two criteria during 2021:

- Required continuous sampling or periodic confirmatory measurements (including 40 CFR 61, Appendix D calculations) in accordance with 40 CFR 61, Subpart H (2002), and with WAC 246-247 (2021)
- Was described in the WDOH-issued RAEL-005 and remained a registered emission unit during 2021.

Table 1.3 lists the PNNL Richland Campus emission units registered with the WDOH for radiological emissions. Potential Impact Categories for each emission unit are provided (Barnett 2018).

Table 1.3. PNNL Richland Campus Registered Radioactive Air Emissions Units

Building	Discharge Point ID	Discharge Point Description	Compliance Method ^(a)
3410	EP-3410-01-S	Major point source. Main stack. PIC-2.	Continuous sampling, Appendix D
3420	EP-3420-01-S	Major point source. Main stack. PIC-2.	Continuous sampling, Appendix D
	EP-3420-02-S	Minor point source. Areas not exhausted to main stack. Calculations used to determine radionuclide emissions in lieu of monitoring. PIC-4.	Appendix D
3425	J-3425	Fugitive emissions. Calculations used to determine radionuclide emissions in lieu of monitoring. PIC-4.	Appendix D
3430	EP-3430-01-S	Major point source. Main stack. PIC-2.	Continuous sampling, Appendix D
	EP-3430-02-S	Minor point source. Areas not exhausted to main stack. Calculations used to determine radionuclide emissions in lieu of monitoring. PIC-4.	Appendix D
Campus	J-VRRM	Volumetrically released radioactive material	PIC-5
	J-NDRM	Non-dispersible radioactive material	PIC-5
	J-Facilities Restoration	Facilities restoration	PIC-5
	J-SIOC	Sources for instrument/operational checks	PIC-5

(a) Appendix D means that values are calculated from in-facility material inventories and estimates and 40 CFR 61, Appendix D (1989). PIC-5 source compliance indicated per permit methods during years that the source is used.

1.2.1 Emission Point Characteristics

In general, radionuclide air emissions from point sources are discharged from stacks and vents. Table 1.4 provides the emission point characteristics for the sampled emission units. The stack configuration of EP-3420-01-S was changed later in 2020 to increase flow rates, which is reflected in the increased annual flow rate for CY2021. The effective discharge height of 3410-01-S used in modeling was 103 ft (31.5 m) and was applied to all PSF major stack emissions, as a conservative assumption. Neither the J-Facilities Restoration nor J-SOIC PIC-5 permits were implemented in 2021.

High-efficiency particulate air (HEPA) filters were the principal emission abatement method used at the major emission units to remove radioactive constituents from stack emissions. In general, one-stage of HEPA filtration was used as the final particulate-removal method before an air emission stream was exhausted to the atmosphere. (Table 1.4 lists the emission abatement technologies at sampled stacks.) The single-stage HEPA filter abatement technology listed in the table has a minimum acceptable test criteria rating of 99% efficient.

Table 1.4. Characteristics of Sampled Emission Points

Unit Type/ Emission Point ID	Average Flow Rate	Total Flow	Temper- ature	Physical Discharge Height	Physical Discharge Diameter	Effective Discharge Height	Abatement Technology
Major EP-3410-01-S	20,293 ft ³ /min (9.58 m ³ /s)	1.07E+10 ft ³ (3.02E+08 m ³)	80.0° F (26.7° C) ^(a)	44 ft (13.5 m)	3.3 ft (1.0 m)	103 ft (31.5 m)	Single-stage HEPA filter
Major EP-3420-01-S	65,189 ft ³ /min (30.8 m ³ /s)	3.43E+10 ft ³ (9.70E+08 m ³)	76.2° F (24.6° C)	51 ft (15.5 m)	4.3 ft (1.3 m)	164 ft (50.0 m)	Single-stage HEPA filter
Major EP-3430-01-S	33,244 ft ³ /min (15.7 m ³ /s)	1.75E+10 ft ³ (4.95E+08 m ³)	74.4° F (23.6° C)	44 ft (13.5 m)	3.7 ft (1.1 m)	120 ft (36.4 m)	Single-stage HEPA filter

(a) EP-3410-01-S emission unit five-year average temperature (75°F [23.9°C]; Barnett and Snyder 2021) used for effective discharge height determination due to unusually high regional temperature on date of the traverse measurement.

1.2.2 PNNL Richland Campus Radiological Operations

This section describes the handling and processing of radioactive material in each facility on the PNNL Richland Campus.

Physical Sciences Facility Buildings

3410 Building – Materials Sciences and Technology Laboratory

The 3410 Building provides laboratory space and infrastructure for research associated with performance and life of materials in high-temperature, high-radiation, and corrosive environments found in next-generation technologies and applications for energy, construction, and transportation. Researchers work with metals, ceramics, polymeric materials, composites, and specialized coatings, and surface treatments to study these situations. Radioactive material emissions are discharged from this building through a major stack.

3420 Building – Radiation Detection Laboratory

The 3420 Building contains laboratories for a wide variety of radionuclide measurements. Projects support research in radionuclide measurement technologies, and capabilities used or under development include state-of-the-art analytical chemistry, radiation physics, light detection, particle detection, chromatography, scintillation materials, sorbents/“smart” materials, and field-deployable instrumentation.

Applications for these capabilities range from fundamental science to applied systems. Radioactive material emissions are discharged from this building through either the major stack or the minor stack.

3425 Building – Underground Laboratory (Deep Lab)

The 3425 Building is an underground laboratory protected from background radiation to support the radiation detection capabilities in the 3420 Building. Research areas are located 40 ft (12 m) below ground. Projects support the development and advancement of radiation detection technologies. Additional activities include radiation physics experiments, development of ultra-low radioactivity materials, and other fundamental sciences studies. Radioactive material emissions from this building are fugitive emissions.

3430 Building – Ultra-Trace Laboratory

The 3430 Building provides ultra-trace radioanalytical capabilities for nuclear forensics. These capabilities include highly sensitive analytical systems such as mass spectrometers, optical microscopes, and electron microscopes to provide isotopic analyses and ultra-low-level radionuclide detection in a wide variety of sample matrices. Radioactive material emissions are discharged from this building through either the major stack or a minor stack.

2.0 Radionuclide Air Emissions

This section presents information on quantities of radionuclide emissions on the PNNL Richland Campus. The sampled point sources listed are actively ventilated stacks using electrically powered exhausters and from which emissions are discharged under controlled conditions. Also included are minor and fugitive emission units.

Three tables are provided to indicate emissions from Richland Campus sources:

- Table 2.1 indicates emissions from sampled point sources on the Campus in 2021.
- Minor point and fugitive source emissions are shown in two tables
 - Table 2.2 shows the emissions that resulted in 99.9% of the dose impact from minor and fugitive emission units, whereas
 - Table 2.3 shows the remaining 0.1%.

Table 2.4 summarizes the nuclide emissions from major sources and from minor, and fugitive sources that result in more than 99.9% of the total dose impact to the MEI. Appendix B lists the radioactive materials handled or potentially handled at the PNNL Richland Campus in 2021.

Table 2.1. Campus Radionuclide Emissions (Ci) from Sampled Point Sources in 2021

Nuclide	EP-3410-01-S 3410 Building	EP-3420-01-S 3420 Building	EP-3430-01-S 3430 Building	Total (Ci)

Total Ci may not equal the major and the minor and fugitive sum due to rounding.

- (a) Nuclides that contribute 99.9% of the minor and fugitive dose to the MEI. See Table 2.3 for the nuclides that contribute the remaining 0.1% of dose impact.
- (b) Maximum of the biweekly or semi-annual average measurement. Gross α is assumed to be Pu-239 and gross β is assumed to be Cs-137 for dose assessment.
- (c) Value based on release records.

3.0 Dose Assessment

This section presents the method for determining the MEI dose from PNNL Richland Campus radiological emissions.

3.1 Description of Dose Model and Receptor Evaluation

The dose to the MEI was calculated using the dose-modeling program Clean Air Act Assessment Package 1988-Personal Computer (CAP88-PC) Version 4.0 (EPA 2015), approved by the U.S. Environmental Protection Agency. This dose value was used to determine compliance of the PNNL Richland Campus with the dose standard of 10 mrem/yr EDE to any member of the public as required by 40 CFR 61, Subpart H (2002), and WAC 246-247 (2021).

CAP88-PC Version 4.0 is an environmental dispersion model that allows user-entered emission point characteristics, annual emissions, site-specific meteorology, and public exposure characteristics to be used to calculate the dose to an exposed individual. This model is used to determine the dose to the MEI from Campus radionuclide emissions (Table 2.4).

The nearest location (e.g., dwelling, business, school, office) to the PNNL Richland Campus where a public receptor has the potential to receive the maximum exposure from RAEL-005 permitted emission units is determined. This may be a hypothetical person, but there must be some potential for continued occupancy at the location indicated. For example, the Campus northwest fence-line was not considered because no individual routinely occupies this location, which is in a shrub-steppe field. In addition to the nearest location, the location with the potential for the greatest annual impact from emissions is determined. Due to the proximity of offsite businesses and the annual variability of dispersion estimates at close distances, several options for businesses at boundary locations are the likely maximally impacted locations based on past evaluations. Table 3.1 indicates the location of the 2021 MEI and provides information on these nearest receptors, including distances to the nearest farms that produce milk, meat, and vegetables.

The PNNL Richland Campus MEI is a member of the public who hypothetically receives the highest calculated radiological dose attributable to exposure to Campus emissions in one calendar year. Selection of the annual MEI is contingent on an individual's place of residence or employment.

Potential MEI locations are evaluated with 1) the CAP88-PC Version 4.0 model, 2) PNNL Richland Campus facility emissions and release point characterization, and 3) CY2021 meteorological data (Appendix A) to determine the 2021 MEI receptor location from Campus emissions. The receptor is presumed to produce their own food supply at the MEI location.

The CY2021 MEI location was determined to be an office building at 3200 George Washington Way. Due to coronavirus measures, the majority of employees working at both PNNL and other north Richland businesses was severely reduced, starting in March 2020. The CY2020 MEI location was a restaurant that was in business for a portion of 2020. The restaurant was not open for all of 2021. Therefore, the MEI location was determined to be the office just south of the restaurant. In contrast to most years but similar to 2020, the CY2021 MEI dose was predominantly from minor and fugitive source emissions, rather than resulting from the major stack emissions. The reduced emissions from the major stacks might be considered a consequence of coronavirus restrictions to onsite work.

Table 3.1. Receptor Locations for the PNNL Richland Campus

Locale	Distance Relative to PSF km (mi)
2021 PNNL Richland Campus MEI	
Office, 3200 George Washington Way	0.64 (0.40) SSE

CY2011 / 1.7E-05 mrem	0.55 (0.34) SSE
(a) Locations with PNNL access control are considered part of the PNNL Richland Campus.	
(b) This location is 2.47 km south of the Hanford Site 300 Area.	
(c) This location is 2.31 km south of the Hanford Site 300 Area.	
(d) To convert mrem to mSv, multiply mrem by 0.01. Dose includes point, non-point, and radon emissions.	

3.2 Summary of Input Parameters

Radionuclide emissions data from the PNNL Richland Campus (Table 2.4) were used in the dose calculations. Emissions were modeled in CAP88-PC Version 4.0 with 2021 meteorology and applicable stack characteristics given in Section 1.2.1. The greatest dose impact from facility emissions is calculated for 3200 George Washington Way, SSE of the 3410 Building, where an office is located; as a result, this is the 2021 MEI location. PSF emissions reported as gross alpha or gross beta were conservatively evaluated as Pu-239 or Cs-137, respectively. Appendix A provides additional data used for dose calculations; all other radionuclide-specific parameters used were default values in CAP88-PC Version 4.0 data libraries. The entire hypothetical MEI diet was constructed using the “local” food production option in CAP88-PC for ingestion-pathway parameters. This assumption overestimates the dose to the MEI because no food is grown at the 2021 MEI location.

Figure 3.1. Locations of PNNL Richland Campus Potential Receptors

3.3 Meteorological Data

Radionuclide air emissions disperse once they enter the atmosphere. Atmospheric dispersion models predict the degree of dilution and the magnitude of resulting air concentrations at downwind locations. Site-specific measurements of the occurrence frequencies for wind speed, wind direction, and atmospheric stability are used in the CAP88-PC model.

Radionuclide air concentrations at receptor locations are determined using the site-specific meteorological data. CAP88-PC Version 4.0 wind files were prepared from data collected at the Hanford Site 300 Area meteorological tower, just north of the PNNL Richland Campus (refer to Figure 5.1), representing the average of hourly data recorded in 2021. Appendix A tables indicate meteorological data for 2021 as joint frequency of wind speed, wind direction, and stability category for the Hanford Site 300 Area station. The proximity of the 300 Area meteorological station (less than 500 m from the Campus boundary) and lack of turbulent interference allows that station data to be used to represent the PNNL Richland Campus meteorology. The data used for stability category determinations was substituted for a part of CY2021 (November 3–December 31). Typically, 10-m and 61-m temperature instrumentation is used in the determinations. However, the 10-m thermometer results were inadequate for that portion of the year. Temperature measurements from 15-m instruments were used as sufficient replacements.

3.4 Compliance Assessment

Federal and state reporting requirements for doses (summarized in Table 3.2) vary. Section 3.4.1 and Section 3.4.2 give details on doses reported under 40 CFR 61, Subpart H, and the WAC, respectively.

Table 3.2. Summary of Reported 2021 Doses

	40 CFR 61, Subpart H Campus MEI (3200 GW Way)	WAC 246-247 Campus MEI (3200 GW Way)	Offsite Maximum Air^(b) for Campus Emissions (PNL-1 station)

NA = not applicable.

To convert Ci to GBq, multiply Ci by 37. To convert mrem to mSv, multiply mrem by 0.01.

(a) Dose from routine major and minor points' emissions, fugitive emissions, PIC-5, and nonroutine events.

(b) WAC 173-480. See Figure 5.1 for PNL-1 ambient air surveillance station location.

3.4.1 40 CFR 61, Subpart H, Regulatory Standard

The regulatory standard for a maximum dose to any member of the public is 10 mrem/yr (0.10 mSv/yr) EDE. The standard is in 40 CFR 61, Subpart H (2002), and applies to radionuclide air emissions, other than radon, from DOE facilities. For CY2021, the PNNL Richland Campus MEI location was 0.64 km (0.40 mi) SSE of the PSF (3410 Building). The PNNL Richland Campus MEI dose is 1.8E-05 mrem (1.8E-07 mSv) (see Table 3.2, 40 CFR 61, Subpart H).

Table 3.3 indicates nuclide-specific doses to the CY2021 Campus MEI. The MEI dose includes routine and, as applicable, nonroutine point source emissions (see Section 3.5). The fugitive PIC-5 category doses are about 6% of the CY2021 PNNL Richland Campus MEI dose estimate.

(a) Release in whole or in part based on 40 CFR 61, Appendix D (1989), release records, or measurements. See Table 2.1 and Table 2.2.

(b) Gross alpha from PSF emission unit sampling assumed to be Pu-239.

(c) Gross beta from PSF emission unit sampling assumed to be Cs-137.

(d) Dose includes progeny isotope Rn-222.

(e) The PIC-5 emission doses are assigned based on permit value. The SOIC and Facilities Restoration emission sources were not implemented in 2021. The SOIC PIC-5 permit has been alternatively referred to as the LLS PIC-5 permit.

(f) Totals may not add up to value indicated due to rounding.

Table 3.4 provides the Campus MEI dose attributed to each emission point. The doses assigned to the fugitive VRRM and NDRM PIC-5 permitted emissions indicate a maximum dose impact. The PIC-5 permitted emissions for J-SOIC and Facilities Restoration were not applicable for 2021 operations.

Table 3.4. Dose Contributions from Each Registered Emission Point

Facility/Building	Emission Unit	Emissions ^(a)	Campus MEI Dose (mrem EDE)	% of Total MEI Dose
PSF/3420 Building	3420-01-S	Sampled, Estimated	7.2E-06	40%
PSF/3420 Building	3420-02-S	Estimated	6.3E-06	35%
PSF/3430 Building	3430-01-S	Sampled, Estimated	1.7E-06	9%
PSF/3410 Building	3410-01-S	Sampled, Estimated	1.5E-06	8%
Campus	VRRM	PIC-5	9.4E-07 ^(b)	5%
PSF/3425 Building	J-3425	Estimated	2.1E-07	1%
PSF/3430 Building	3430-02-S	Estimated	1.3E-07	1%
Campus	NDRM	PIC-5	6.6E-08 ^(b)	<1%
Campus	Facility Restoration	PIC-5	0 ^(b)	0%
Campus	J-SOIC	PIC-5	0 ^(b)	0%

To convert mrem to mSv, multiply mrem by 0.01.

(a) Emissions “estimated” are determined by 40 CFR 61, Appendix D.

(b) Dose assigned by permit determination, or for J-SOIC a dose estimate may be done.

For comparison, the Subpart H PNNL Richland Campus 2021 MEI dose and average U.S. background radiation (NCRP 2009) are shown below:

• Annual natural background radiation	310.0	mrem/yr
• Daily natural background radiation	0.85	mrem/d
• Hourly natural background radiation	0.035	mrem/hr
• Per minute natural background radiation	0.00059	mrem/min
• PNNL Richland Campus 2021 MEI dose (40 CFR 61, Subpart H)	0.000018	mrem/yr
• Per second natural background radiation	0.0000098	mrem/sec

Dose from anthropogenic sources, overwhelmingly a result of medical procedure exposures, adds another 310 mrem (3.1 mSv) to the annual average U.S. dose (HPS 2012). Last year, the PNNL Richland Campus MEI dose was 1.7E-05 mrem/yr (1.7E-07 mSv/yr).

3.4.2 Washington Administrative Code

For PNNL Richland Campus radionuclide air emissions, Washington State in WAC 246-247-040(1) (2021) has adopted the federal dose standard of 10 mrem/yr found in 40 CFR 61, Subpart H (2002). In addition to the maximum dose attributable to radionuclides emitted from point sources, WAC 246-247-040(6) requires that the dose to the MEI also include doses attributable to fugitive emissions, radon, and nonroutine events. Radon is exempt from consideration in determining compliance with the dose standard of 40 CFR 61, Subpart H (2002), but it is encompassed by state regulations, as in WAC-246-247-040(6), which states that “[a]ll emissions of radionuclides . . . are subject to the standards of this section.”

The WAC 246-247 receptor location considers whether an individual resides or abides at the evaluated location (see Table 3.2, WAC 246-247). For 2021, the WAC-246-247 dose is the 1.8E-05 mrem/yr

(1.8E-07 mSv/yr). An additional assessment was performed for the location with maximum offsite nuclide air concentrations, whether the reside/abide criterion was met or not (see Table 3.2, WAC 173-480). For CY2021, the maximum modeled air concentration is at the PNL-1 ambient sampling station, on the western PNNL Richland Campus boundary; this WAC 173-480 dose is 2.1E-05 mrem/yr (2.1E-07 mSv/yr).

3.4.3 PNNL Richland Campus and Hanford Site Subpart H Doses

For information purposes only, the nearby Hanford Site, which is the adjacent DOE site with major emissions units, was considered for comparative evaluation. PNNL Richland Campus air compliance is a distinctly separate issue, but the dose from such nearby major radiological emitters is worth considering for total DOE-source impacts to the region. Hanford Site 300 Area emissions and the Hanford Site MEI for CY2021 were reviewed. Both the PNNL Richland Campus and the Hanford Site (Dyekman et al. 2022) are in compliance with the 10 mrem/yr regulatory standard for CY2021 radiological emissions.

The CY2021 Hanford Site MEI location is on the PNNL Richland Campus, directly south of the Hanford Site 300 Area. As a result, no dose to the Hanford Site MEI from Campus emissions was estimated for 2021. The dose to the PNNL Richland Campus MEI from the Hanford Site 300 Area emissions, excluding Rn-220 and Rn-222 (see Dyekman et al. 2022), is indicated in Table 3.5. Essentially all of the dose from Hanford Site 300 Area emissions to the PNNL Richland Campus MEI is attributable to H-3 releases. The table also indicates the dose to the 2021 Hanford Site MEI for emissions from the Hanford Site 300 Area sources.

Table 3.5. Subpart H Doses to PNNL Richland Campus MEI and Hanford Site MEI

Receptor	Dose from 2021 PNNL Richland Campus Emissions	Dose from 2021 Hanford Site 300 Area Emissions
Hanford Site 2021 MEI	NA ^(a)	5.5E-02 mrem
PNNL Richland Campus 2021 MEI	1.8E-05 mrem	3.6E-02 mrem

NA = not applicable.
To convert mrem to mSv, multiply mrem by 0.01.
(a) Hanford Site receptor is located at the PNNL Richland Campus.

3.5 Nonroutine Releases of Radionuclides to the Atmosphere

No nonroutine emissions were reported in 2021.

3.6 Additional Compliance Information

3.6.1 Applicability of Stack Emissions Data to Air Emission Permits and Licenses

The WDOH license (RAEL-005) requires that an environmental monitoring program be established for the PNNL Richland Campus as a condition of operation. Environmental monitoring supplements the required stack sampling and provides additional assurance that airborne radiological releases comply with federal and state standards. The requirements for site selection and sampling program optimization are

PNNL-20436-12

documented in Snyder et al. 2017. There are currently five particulate ambient air sampling stations. The Campus Environmental Monitoring Plan is documented in Snyder et al. 2020.

3.6.2 Reporting Construction Projects and Modifications Under 40 CFR 61.96

No approvals under 40 CFR 61.96 were requested or granted in 2021.

3.6.3 Radon-220 and Radon-222 Emissions

Radon-220 was not emitted from PNNL Richland Campus operations in 2021. Some Rn-222 was emitted. See Section 3.4 for radon emissions and dose results.

4.0 Fugitive Sources of Emissions

The Clean Air Act (i.e., 40 CFR 61, Subpart H [2002]) governs emissions of radionuclides from DOE facilities and the resulting radiological doses to members of the public. A dose standard of 10 mrem/yr EDE was implemented, to which compliance is expected for radionuclide emissions emanating from both point and fugitive sources. Measuring and/or modeling these emissions are fundamental to demonstrating compliance with the standard.

In general, fugitive sources of radioactive emissions are radionuclide air emissions that do not and could not reasonably pass through a stack, vent, or other functionally equivalent structure and that are not feasible to measure directly or quantify (WAC 246-247-030 [2021]). Some fugitive sources can be classified as diffuse (i.e., area) sources (DOE 2015). The PNNL Richland Campus has no diffuse sources.

PNNL facility-specific fugitive sources include only J-3425 in 2021. In addition to facility-specific fugitive sources, Campus-wide permits for fugitive emissions are registered with WDOH. These include the following:

- J-VRRM Volumetrically released radioactive material
- J-NDRM Non-dispersible radioactive material
- J-Facilities Restoration Facilities restoration
- J-SIOC Sources for instrument/operational checks

These four permitted fugitive emissions sources are managed such that the assigned dose (see Table 3.3) over-estimates the actual dose from respective applicable Campus-wide releases. These permits include PIC-5 (Barnett 2018) levels of radionuclide emissions and cover a broad range of the nuclides, as listed in Appendix B.

The 2021 PNNL Richland Campus emissions from facility fugitive sources were estimated (see Table 2.2 for a list of dose-significant emissions) and dose was determined (see Table 3.4). Table 3.4 also indicates the relative magnitudes and the permit-assigned doses from Campus-wide fugitive emission sources. Fugitive emissions from facility and permitted fugitive emissions account for 1.2E-06 mrem/yr (2.0E-08 mSv/yr) (12%) of the total 1.8E-05 mrem/yr (1.8E-07 mSv/yr) MEI dose for 2021.

Emissions from fugitive sources mix with ambient air, which may also include emissions from point sources. Emissions from all PNNL Richland Campus sources *and* non-PNNL and background sources are monitored by five particulate air sampling stations. The air surveillance program conducted in 2021 is described in Section 5.3.

Past operations at the nearby Hanford Site created a number of fugitive sources within the landscape, whose emissions could affect the PNNL Richland Campus. The Hanford Site fugitive emissions are evaluated in detail in their Radiological Air Emissions Report (e.g., Dyekman et al. 2022).

5.0 Supplemental Information

This section provides the following supplemental information related to PNNL Richland Campus radionuclide air emissions in 2021:

- Collective dose estimate (DOE 1995)
- Compliance status with 40 CFR 61, Subparts Q (2000) and T (2000)
- Radionuclide emission estimates and periodic confirmatory measurement information related to notices of construction
- Ambient air sampling measurements
- Quality assurance (QA) program status of compliance with 40 CFR 61, Appendix B (2011), Method 114

5.1 Collective Dose Estimate

The estimated regional collective dose from PNNL Richland Campus air emissions in 2021 was calculated using CAP88-PC Version 4.0. The population consists of approximately 432,950 residents within a 50-mi (80-km) radius of the Hanford Site 300 Area (Hamilton and Snyder 2011), with the following adjustments: add 640 residents in the 1-2 mi S sector to account for the two phases of apartment units just south of the Campus and add 190 residents in the 1-2 mi SSE sector to account for the first phase of apartments just north of the Washington State University Tri-Cities. The proximity of the Hanford Site 300 Area and relatively rural region within 50 mi of the Campus permits the Hanford Site 300 Area 50-mi population estimate to be applicable. Pathways evaluated for population exposure include inhalation, air submersion, ground-shine, and food consumption.

The 2021 total collective dose from radionuclide air emissions estimated from nuclides that originated from the PNNL Richland Campus was $9.7\text{E-}05$ person-rem ($9.7\text{E-}07$ person-Sv). CAP88-PC Version 4.0 calculates the collective dose by considering site-specific meteorology and population distributions and subsequently summing the individual sector doses. This represents a slight increase from the 2020 estimate of $9.0\text{E-}05$ person-rem ($9.0\text{E-}07$ person-Sv) (Snyder et al. 2021).

5.2 Compliance Status with 40 CFR, Subparts Q and T

In 40 CFR 61, Subpart Q (2000), “National Emission Standards for Radon Emissions From Department of Energy Facilities,” paragraph 61.190 states that the Subpart Q provisions apply to the design and operation of all storage and disposal facilities for radium-bearing material that emits Rn-222 to the air. Paragraph 61.191(b) states that a source means any building, structure, pile, impoundment, or area used for interim storage or disposal that is or contains waste material containing radium in sufficient concentration to emit Rn-222 in excess of a standard of $20\text{ pCi/m}^2/\text{s}$. No operations from the storage and disposal of radium-bearing material resulting in radon emissions are conducted on the PNNL Richland Campus.

Activities at the PNNL Richland Campus were evaluated for compliance with 40 CFR 61, Subpart T (2000), “National Emission Standards for Radon Emissions from the Disposal of Uranium Mill Tailings.” In paragraph 61.220, “Designation of Facilities,” owners and operators of such facilities are subject to the provisions in Subpart T: those whose sites were used for the disposal of tailings and that managed residual radioactive material or uranium byproduct materials during and following the

processing of uranium ores and that are listed in or designated by the Secretary of Energy under Title I of the Uranium Mill Tailings Control Act of 1978 or regulated under Title II of that act. No uranium milling and uranium ore processing activities are conducted on the PNNL Richland Campus.

Subparts Q and T do not apply to the PNNL Richland Campus for CY2021 operations.

5.3 Environmental Surveillance for the PNNL Richland Campus

Environmental surveillance activities for the PNNL Richland Campus radionuclide emissions sources include ambient particulate air sampling and ambient external dose monitoring.

5.3.1 Ambient Air Surveillance

A particulate air sampling network was established in 2010 to monitor radioactive particulates in ambient air near the PNNL Richland Campus. This sampling was initiated before starting radiological operations at the new PSF buildings. The first full calendar year of air surveillance was 2011. To satisfy air permit requirements, samples were collected in 2021 at four ambient air sampling stations within and along the perimeter of the PNNL Richland Campus and at a background monitoring station that was established in Benton City, Washington (Figure 5.1). In addition to Campus emissions, these samplers can collect radioactive particulates released from other nearby sources. During 2021, the Hanford Site 300 Area would have contributed most of the non-PNNL particulates detected from offsite facilities.

Routine surveillance activities at the PNNL Richland Campus include air sampling for particulate radionuclides. The air surveillance program is described in Snyder et al. 2020 and attachments (Meier 2011; Bisping 2011; Snyder 2021). During 2021, environmental air surveillance continued at PNL-1 (solar), PNL-2 (solar), PNL-3, PNL-4, and PNL-5 (background location) (Figure 5.1).

Unless conditions warrant otherwise, particulate air samples are routinely collected biweekly (every two weeks) and analyzed for gross alpha activity and gross beta activity. Semi-annually, filters are composited for specific radionuclide analysis. The composite analyses reported for 2021 include gamma-emitting isotopes Co-60 and Cs-137, U-233/234,³ Pu-238 and Pu-239/240, Am-241, Am-243, and Cm-243/244. Starting in CY 2021, gross alpha and gross beta analyses were also added to the list of required composite analyses.

Off-site events affected the ambient sampling program in 2021 included extreme heatwave in June/July and numerous wildfires in the Pacific Northwest caused continuous smoky days in August 2021. The wildfire smoke events were particularly thick and resulted in consecutive days of unhealthy to hazardous air quality levels. During these periods when high levels of particulate matter were trapped beneath a local inversion layer, ambient air sampling stations were evaluated more frequently to ensure air flow to the sampler was maintained. In August, two of the five particulate air sampling stations (solar-powered stations PNL-1 and PNL-2) required a weekly instead of biweekly filter change-out to maintain sampler air flow. On these occasions, the air filters that sampled for one-week collected sufficient volume for gross alpha, gross beta analyses. In addition, prior to performing the second-half 2021, semiannual composite sample analyses, the analytical laboratory informed PNNL they were unable to locate the air particulate filters collected in August 2021 (i.e., loss of eight particulate filters collected on a weekly frequency and six particulate filters collected on a biweekly frequency). As a result, the sample volume(s) reported for the particulate samples collected in August 2021 and analyzed for gross alpha and

³ U-234 is a naturally occurring radionuclide. It is co-reported with U-233 by the analytical laboratory because the emission peaks overlap.

gross beta, are not included in the composite sample volume. The reduced composite sample volume was determined to be sufficient for performing the requested composite analyses. The two solar stations (PNL-1 and PNL-2) also had a scheduled maintenance outage in March 2021 in order to replace the solar panel batteries. There was no significant impact to the annual composite results or station operational frequency for CY2021, because of these events.

The particulate ambient air sampling results are provided in Appendix C for the CY2021 PNNL Richland Campus sampling. Air sampling results are summarized in Table 5.1. The gross alpha and gross beta results were comparable to background levels. All nuclide-specific results shown in Table 5.1 were less than the values in Table 2 of 40 CFR 61, Appendix E (2011). There was no indication that levels of monitored particulate radionuclides near the PNNL Richland Campus were above standards.

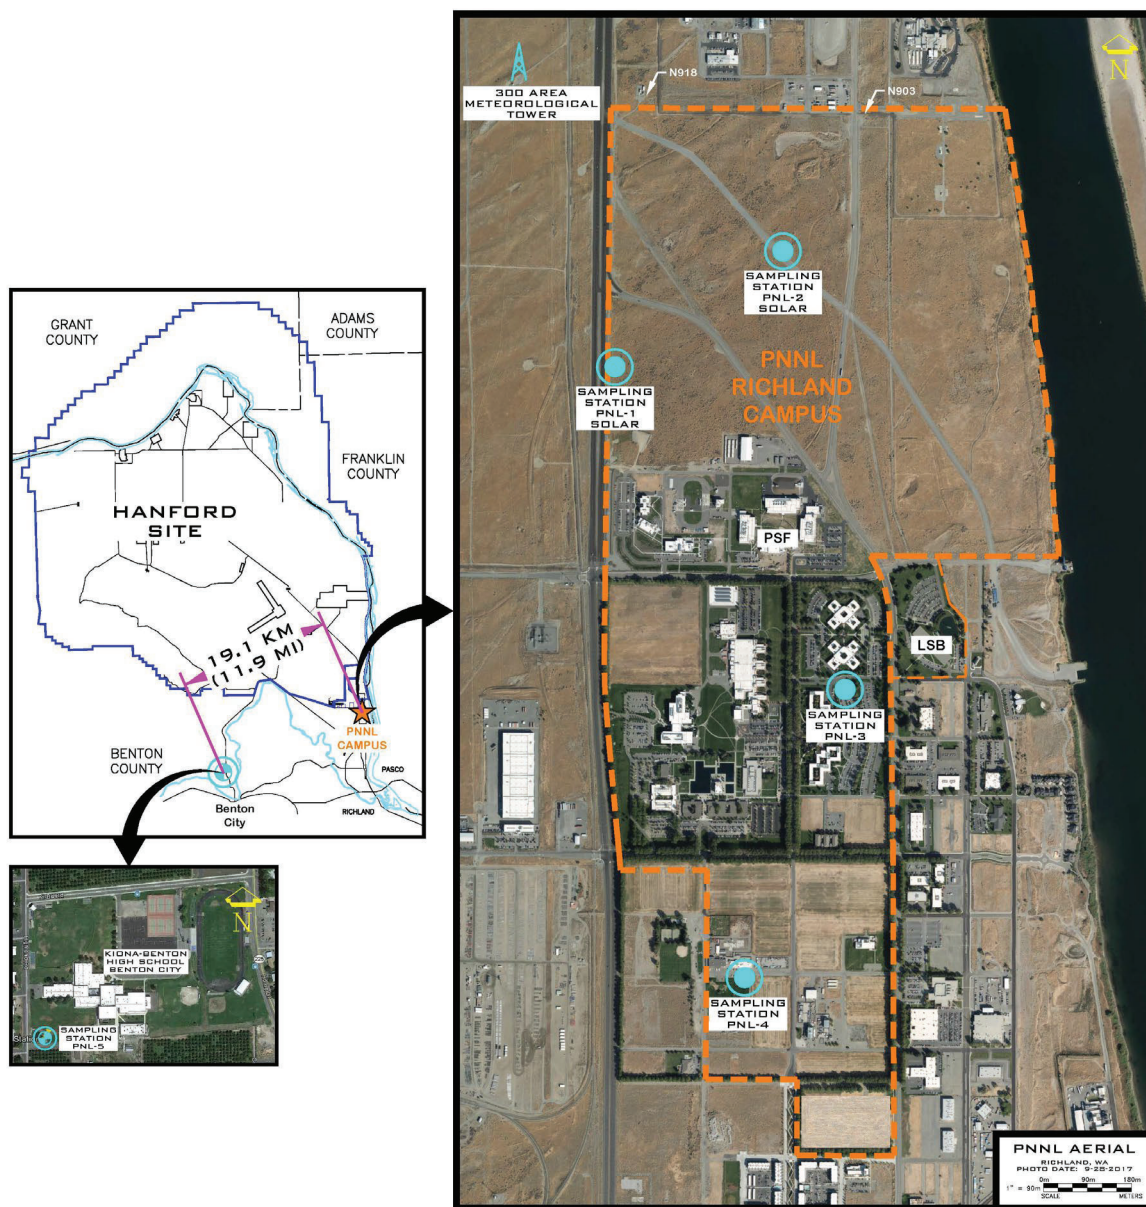

Figure 5.1. Air Surveillance Station Locations for the PNNL Richland Campus

To convert pCi/m³ to Bq/m³, multiply pCi/m³ by 0.037.

(a) Refer to Figure 5.1 for PNL-1, PNL-2, PNL-3, PNL-4, and PNL-5 locations.

(b) The Value is the average of samples collected throughout the year, with no background (PNL-5) results subtracted.

(c) Semiannual composite analyses.

(d) The detected value is greater than the 2-sigma error; however, the result was flagged by the analytical laboratory as biased high due to possible interference (see Appendix C).

5.3.2 Ambient External Dose Monitoring

Ambient levels of external dose from beta, gamma, and X-ray sources were monitored quarterly at the five particulate air monitoring stations during 2021. No current PNNL Campus radioactive air emissions include significant quantities of external dose contributors. The program establishes baseline ambient external dose levels at the perimeter particulate sampling stations and the background (PNL-5) station. The 2021 ambient external dose monitoring results at Campus monitoring stations were all less than the background station; the background station indicated a local ambient external dose for 2021 of 37 mrem (0.37 mSv). For comparison, the 2020 background station ambient external dose was 32 mrem/yr (0.32 mSv/yr). Additional details regarding ambient external dose monitoring will be in the next PNNL Site Environmental Report of 2021 operations (e.g., Duncan et al. 2021).

5.4 Quality Assurance Program Compliance Status

Air emissions data reported in this document reflect the product of many QA activities concerned with the collecting, handling, analyzing, validating, and reporting of samples and the resultant analytical data. Those activities are identified in the QA plans (PNNL 2016) and in the PNNL Richland Campus Environmental Radiological Air Monitoring Plan (Snyder et al. 2020). The effluent monitoring QA elements described in PNNL 2016 were compatible with one or more of the documents shown in Table 5.2 during CY2021. QA requirements are implemented, as appropriate, at the Campus as new facilities become operational and programmatic plans are developed.

6.0 Corrigendum for CY2019 and CY2020 Ambient Air Surveillance Reporting

Compliance for PNNL Richland Campus operations were reported in the PNNL Richland Campus Radionuclide Air Emissions Report for Calendar Year 2019 (PNNL-20436-10; Snyder et al. 2020) and Calendar Year 2020 (PNNL-20436-11; Snyder et al. 2021). An error reporting the 2019 and 2020 ambient particulate air composite sample start date/time (SAMP_DATE_TIME_ON field) was identified while preparing a periodic report to management. This date field correction is essentially an editorial correction since the corrections had no impact to the ambient particulate air analytical data reported in Appendix C of the CY2019 or CY2020 compliance reports. Nor did the corrections impact reported average ambient air concentrations indicated in Table 5.1 of both Snyder et al. 2020 and Snyder et al. 2021.

6.1 PNNL-20436-10 Corrections

The 2019 ambient particulate air sampling results for the PNNL Richland Campus are presented in Appendix C of PNNL-20436-10. Six-month composite samples are analyzed for a number of isotopics (e.g., Be-7, Cm-243/244, Eu-155, U-238, etc.). Second-half of 2019 composites with a sample end date (SAMP_DATE_TIME field) of 31-Dec-19 had sample start date/time (SAMP_DATE_TIME_ON field) misreported as 28-Aug-19 hh:mm; the correct date is 19-Jun-19 hh:mm (Table 6.1). This affected 36 isotopic composite sample records reported for each air surveillance station (SAMP_SITE_NAME field).

Table 6.1. Air Sampling Results for the PNNL Richland Campus for Calendar Year 2019-Corrected

SAMP_SITE_NAME	SAMP_NUM	SAMP_DATE_TIME	Original SAMP_DATE_TIME ON	Corrected SAMP_DATE_TIME ON	COMPOSITE_FLAG
PNL-1	B3R3B2	31-Dec-19 08:30	28-Aug-19 09:15	19-Jun-19 11:00	Y
PNL-2	B3R3C7	31-Dec-19 08:50	28-Aug-19 09:30	19-Jun-19 10:30	Y
PNL-3	B3R387	31-Dec-19 09:40	28-Aug-19 10:20	19-Jun-19 09:00	Y

6.2 PNNL-20436-11 Corrections

The 2020 ambient particulate air sampling results for the PNNL Richland Campus are presented in Appendix C of PNNL-20436-11. Six-month composite samples are analyzed for a number of isotopics (e.g., Be-7, Cm-243/244, Eu-155, U-238, etc.). Second-half of 2020 composites with a sample end date (SAMP_DATE_TIME field) of 30-Dec-20 had sample start dates/time (SAMP_DATE_TIME_ON field) misreported as 01-Jul-20 hh:mm; the correct date is 17-Jun-20 hh:mm (Table 6.2). This affected 36 isotopic composite sample records reported for each air surveillance station (SAMP_SITE_NAME field).

Table 6.2. Air Sampling Results for the PNNL Richland Campus for Calendar Year 2020-Corrected

SAMP_SITE_NAME	SAMP_NUM	SAMP_DATE_TIME	Original SAMP_DATE_TIME ON	Corrected SAMP_DATE_TIME ON	COMPOSITE_FLAG
PNL-1	B3WNH0	30-Dec-20 09:30	01-Jul-20 09:30	17-Jun-20 09:00	Y

A.4

Table A.2. Exposure and Consumption Data for the PNNL Richland Campus**FOOD SOURCE FOR THE MAXIMALLY EXPOSED INDIVIDUAL**
(fraction of food produced at indicated location)

<u>Food</u>	<u>Local</u>	<u>Regional</u>	<u>Imported</u>
Vegetable	1.000	0.000	0.000
Meat	1.000	0.000	0.000
Milk	1.000	0.000	0.000

VALUES FOR RADIONUCLIDE-INDEPENDENT VARIABLESHUMAN INHALATION RATE (cm³/hr) = 5.26 E+03**SOIL PARAMETERS**Effective surface density, kg/sq m, dry weight
(assumes 15-cm plow layer) = 2.15 E+02**BUILDUP TIMES**

For activity in soil (yr) = 1.00 E+02

For radionuclides deposited on ground/water (d) = 3.65E+04

DELAY TIMES

Ingestion of pasture grass by animals (hr) = 0.00 E+00

Ingestion of stored feed by animals (hr) = 2.16 E+03

Ingestion of leafy vegetables by man (hr) = 3.36 E+02

Ingestion of produce by man (hours) = 3.36 E+02

Transport time from animal feed-milk-man (d) = 2.00 E+00

Time from slaughter to consumption (d) = 2.00 E+01

WEATHERING

Removal rate constant for physical loss (per hr) = 2.90 E-03

CROP EXPOSURE DURATION

Pasture grass (hr) = 7.20 E+02

Crops/leafy vegetables (hr) = 1.44 E+03

AGRICULTURAL PRODUCTIVITYGrass-cow-milk-man pathway (kg/m²) = 2.80 E-01Produce/leafy veg for human consumption (kg/m²) = 7.16 E-01**FALLOUT INTERCEPTION FRACTIONS**

Vegetables = 2.00 E-01

Pasture = 5.70 E-01

GRAZING PARAMETERS

Fraction of year animals graze on pasture = 4.00 E-01

Fraction of daily feed that is pasture grass when animal grazes on pasture = 4.30 E-01

ANIMAL FEED CONSUMPTION FACTORS

Contaminated feed/forage (kg/day, dry weight) = 1.56 E+01

DAIRY PRODUCTIVITY

Milk production of cow (L/day) = 1.10 E+01

Table A.2. (contd)

MEAT ANIMAL SLAUGHTER PARAMETERS

Muscle mass of animal at slaughter (kg) = 2.00 E+02

Fraction of herd slaughtered (per day) = 3.81 E-03

DECONTAMINATION

Fraction of radioactivity retained after washing
or leafy vegetables and produce = 5.00 E-01

FRACTIONS GROWN IN GARDEN OF INTEREST

Produce ingested = 1.00 E+0

Leafy vegetables ingested = 1.00 E+00

INGESTION RATIOS:

IMMEDIATE SURROUNDING AREA/TOTAL WITHIN AREA

Vegetables = 1.00 E+00

Meat = 1.00 E+00

Milk = 1.00 E+00

MINIMUM INGESTION FRACTIONS FROM OUTSIDE AREA

(Minimum fractions of food types from outside area listed below are actual fixed values.)

Vegetables = 0.00 E+00

Meat = 0.00 E+00

Milk = 0.00 E+00

HUMAN FOOD UTILIZATION FACTORS

Produce ingestion (kg/yr) = 7.62 E+01

Milk ingestion (L/yr) = 5.30 E+01

Meat ingestion (kg/yr) = 8.40 E+01

Leafy vegetable ingestion (kg/yr) = 7.79 E+00

SWIMMING PARAMETERS

Fraction of time spent swimming = 0.00 E+00

Dilution depth for water (cm) = 1.00 E+00

EXTERNAL DOSE

Ground surface contamination correction factor = 5.00 E-01

Table A.3. PNNL Richland Campus Meteorological Data — General Information

HEIGHT OF LID

LIDAI = 1,000 m

RAINFALL RATE [2021]

RR = 13.64 cm/yr (5.37 in/yr)

AVERAGE AIR TEMPERATURE [2021]

A = 13.72 degrees C (56.7 degrees F; 286.9 K)

SURFACE ROUGHNESS LENGTH

0 = 0.010 m

VERTICAL TEMPERATURE GRADIENTS: (TG) (K/m)

STABILITY E 0.073

STABILITY F 0.109

STABILITY G 0.146

Appendix C

Ambient Particulate Air Sampling Results for PNNL Richland Campus Air Surveillance in 2021

Appendix C

Ambient Particulate Air Sampling Results for the PNNL Richland Campus Air Surveillance in 2021

Table C.1. Definitions for Air Sampling Data

Column Heading	Data Type/Format	Content
SAMP SITE NAME	text	Location of monitoring station: <u>PNNL Richland Campus monitoring stations</u> PNL-1, PNL-2, PNL-3, PNL-4 <u>Background Location</u> PNL-5
SAMP MTHD	text	The method used to collect the sample: FILTER2 2" filter paper; 120-volt AC system FILTER2 SOLAR 2" filter paper; 24-volt solar-powered system
LAB SAMP ID	9-digit number	
SAMP DATE TIME ON	date (DD-MMM-YY HH:MM [24 hr])	Date and time when air sampling started (time field is truncated and not displayed in Table C.2).
SAMP DATE TIME	date (DD-MMM-YY HH:MM [24 hr])	Date and time when air sampling ended (time field is truncated and not displayed in Table C.2).
CON SHORT NAME	text	ALPHA, BETA, Am-241, Am-243, Be-7, Cm-243/244, Co-60, Cs-134, Cs-137, Eu-152, Eu-154, Eu-155, K-40, Pu-238, Pu-239/240, Ru-106, Sb-125, U-233/234, U-234, U-235, U-238. The sum of U-233 and U-234 is reported as either U-233/234 or U-234 and used for U-233 reporting.
VALUE RPTD	number (usually scientific notation)	Result reported by the analytical laboratory.
ANAL UNITS RPTD	text	Picocuries per cubic meter. Units associated with the values shown in the VALUE RPTD, COUNTING ERROR, and TOTAL ANAL ERROR 2-SIGMA columns.
COUNTING ERROR	number (usually scientific notation)	The 2-sigma counting error for the radioanalytical results only.
TOTAL ANAL ERROR 2-SIGMA	number (usually scientific notation)	The 2-sigma total analytical error for the radioanalytical results only.
LAB QUALIFIER	text or blank	If "U", the VALUE RPTD was not detected above limiting criteria, which may include any of the following: value_rptd < 0, or < counting_error, or < total_analytical_error, or <= contract method detection limit/instrument detection limit/minimum detectable activity/practical quantitation limit. . If "O", the case narrative contains additional information regarding a quality control criteria not being met. If "X", see text in the Result Comment field regarding radio-analysis. If blank, no qualifier was needed.
SAMP COMMENT	text or blank	Contains pertinent information about the sample. If blank, no comment was needed
RESULT COMMENT	text or blank	Comment on the result. If blank, no comment was needed.
COMPOSITE FLAG	Y or blank	If "Y", several samples from the same sampling station were composited and the composite measured for radioactivity. If blank, a single sample was evaluated.

Further details on each PNNL Richland Campus sample event (e.g., sample volume, analysis method) can be obtained from the project Site Environmental Monitoring (SEM) database and/or the Hanford Environmental Information Systems (HEIS 1989) database.
