Science

# Energy Independence with Sustainability

American Geophysical Union Fall Meeting  
December 4, 2012

Dr. W. F. Brinkman  
Director, Office of Science  
U.S. Department of Energy  
[science.energy.gov](http://science.energy.gov)

# Innovations in Energy Technology must address CO<sub>2</sub> Issue

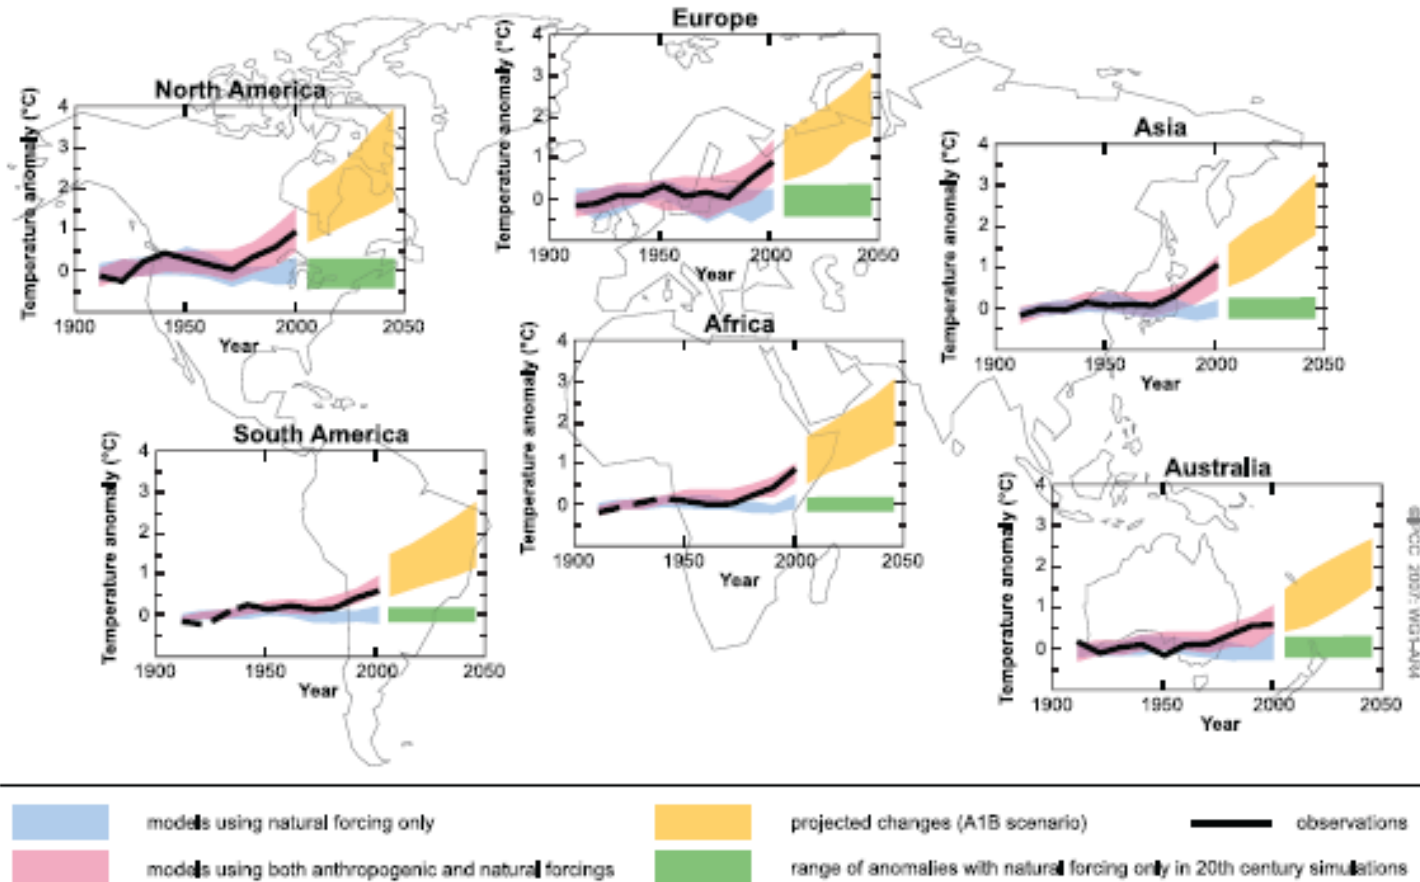

### Atmospheric CO<sub>2</sub> at Mauna Loa Observatory

NASA GISS, update of Hansen et al., *J. Geophys. Res.*, 106, 23947-23963, 2001

# Models capture observed regional temperature warming

## CONTINENTAL SURFACE TEMPERATURE ANOMALIES: OBSERVATIONS AND PROJECTIONS

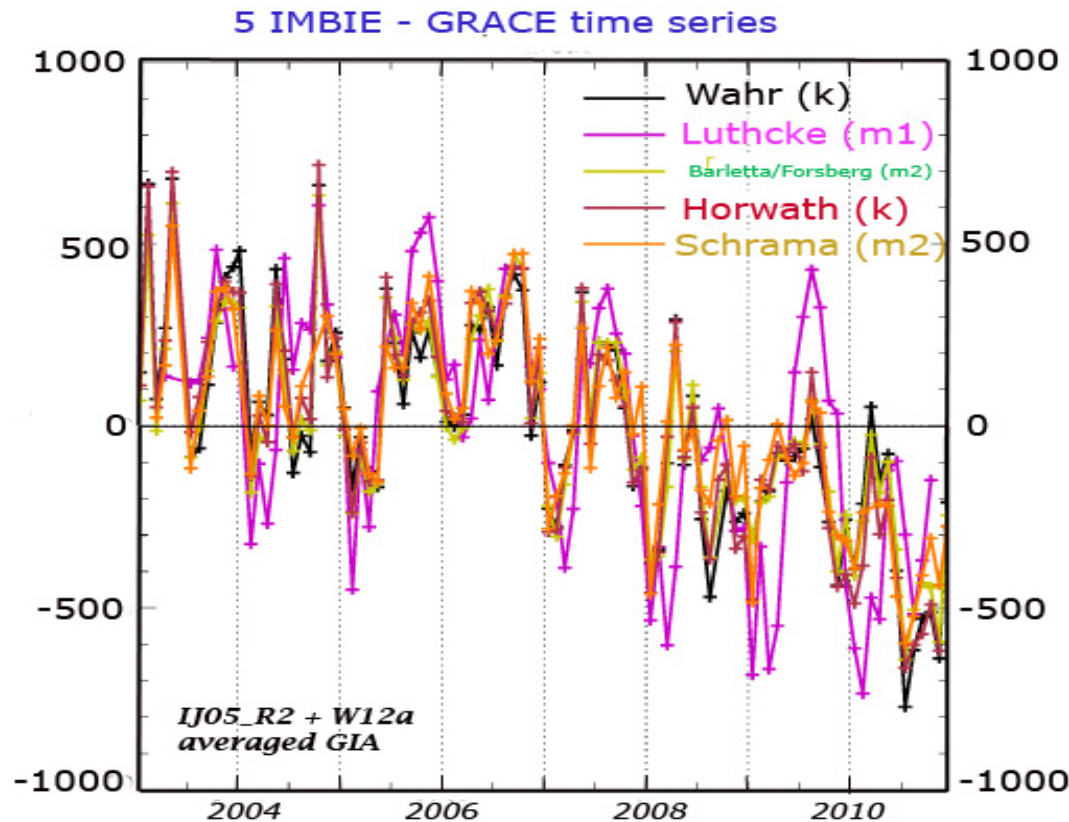

Anthropogenic forcings needed to simulate obs

IPCC 4<sup>th</sup> Assessment

# Ice Sheet Mass Loss – 2003 to 2011

## Ice Sheet Mass Balance Inter-comparison Exercise (IMBIE)

Monthly changes in Antarctic ice mass, in gigatons, as measured by NASA's Gravity Recovery and Climate Experiment (GRACE) satellites from 2003 to 2011.

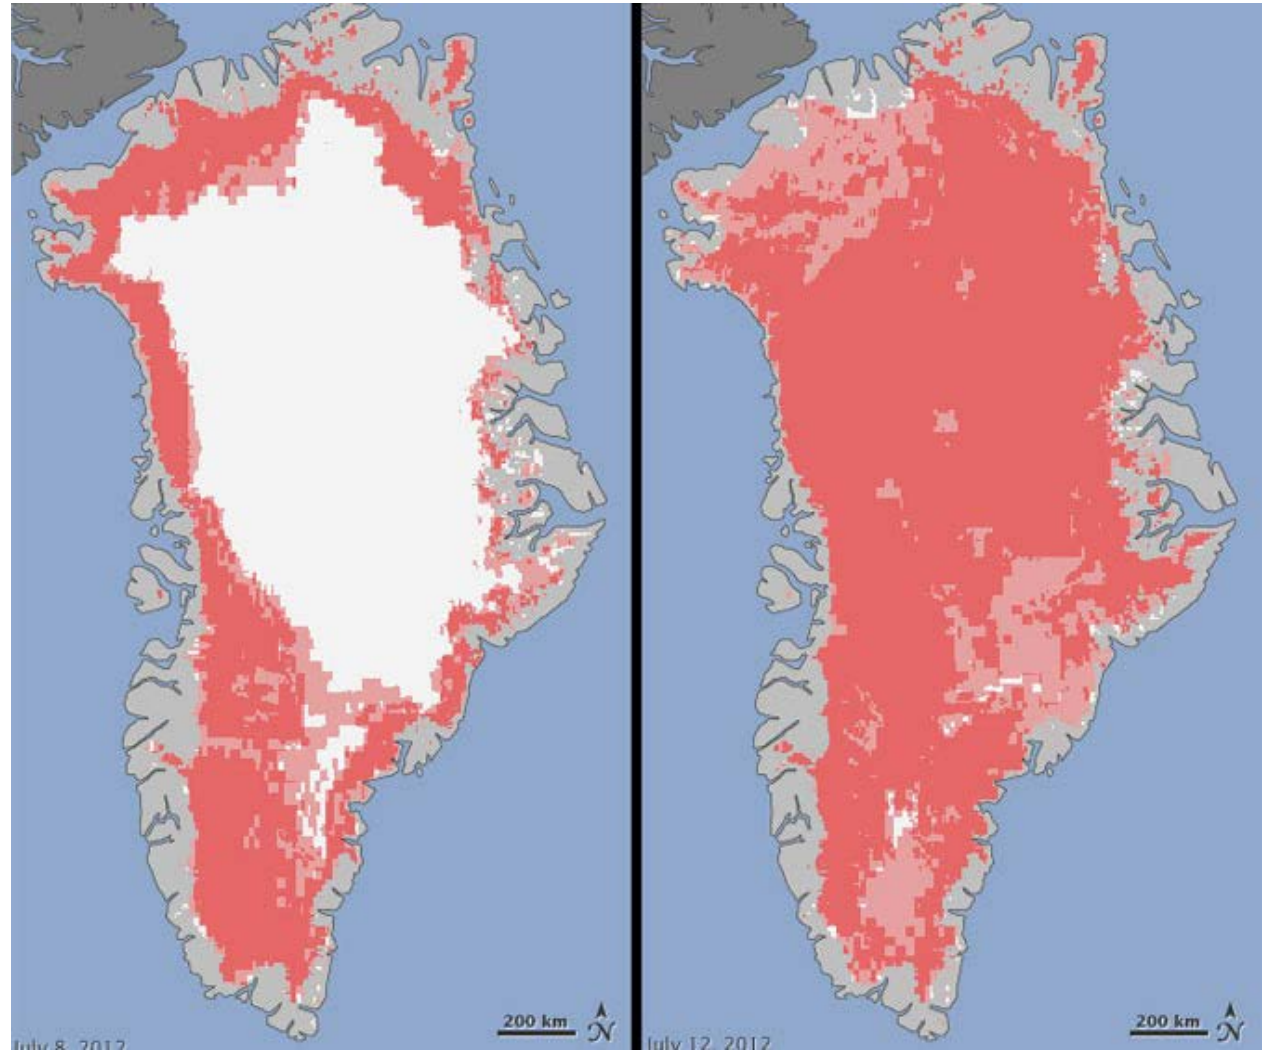

# Satellites See Unprecedented Greenland Ice Sheet Surface Melt in July

**White – no melt**  
**Light pink – probable melt**  
**Pink - melt**

**July 8 – 40 percent**  
of ice sheet surface  
thawed

**July 12 - 97 percent**  
of ice sheet surface  
thawed

# US energy consumption by source

U.S. primary energy consumption  
quadrillion Btu per year

# Growth in Wind Drives Growth in Renewables

**Figure 100. Nonhydropower renewable electricity generation capacity by energy source, including end-use capacity, 2010-2035 (gigawatts)**

**Figure 101. Hydropower and other renewable electricity generation, including end-use generation, 2010-2035 (billion kilowatthours)**

U.S. DEPARTMENT OF  
**ENERGY**

Office of  
Science

**So what can we do?**

**Lots of solutions but  
the real issue is competitive costs  
and economic viability**

**Driving toward more coordinated approach across the department in several important areas:**

**Solar: Sunshot\***

**CCUS\***

**Biofuels**

**GRID**

**Wind**

**Small Reactors\***

**Fuel Cells**

**Geothermal\***

**Fusion\***

**Batteries\***

- The DOE-EERE SunShot Initiative is a collaborative national initiative to make solar energy cost competitive with other forms of energy by the end of the decade and restore U.S. leadership in the global clean energy race

# Agua Caliente Solar Project (First Solar)

Yuma, AZ

290 MW  
(550 MW  
in 2014)

When completed, It will

- power ~ 100,000 homes per year
- displace ~ 220,000 metric tons of CO<sub>2</sub> annually  
(equivalent of taking ~40,000 cars off the road).

Science

## Geothermal

**How can we further tap the Earth as an energy source?**

**Enhanced geothermal systems?**

# Enhanced Geothermal Systems

*The Future: Creating power from hot, tight rocks*

EGS uses advanced technologies to access the heat of the earth and produce electricity.

### Targeting 1<sup>st</sup>-ever:

- Horizontal geothermal wells
- Multi-stage stimulations
- Long term Hi-T/Hi-P tool and technique testing
- Highly controlled modern R&D and data collection

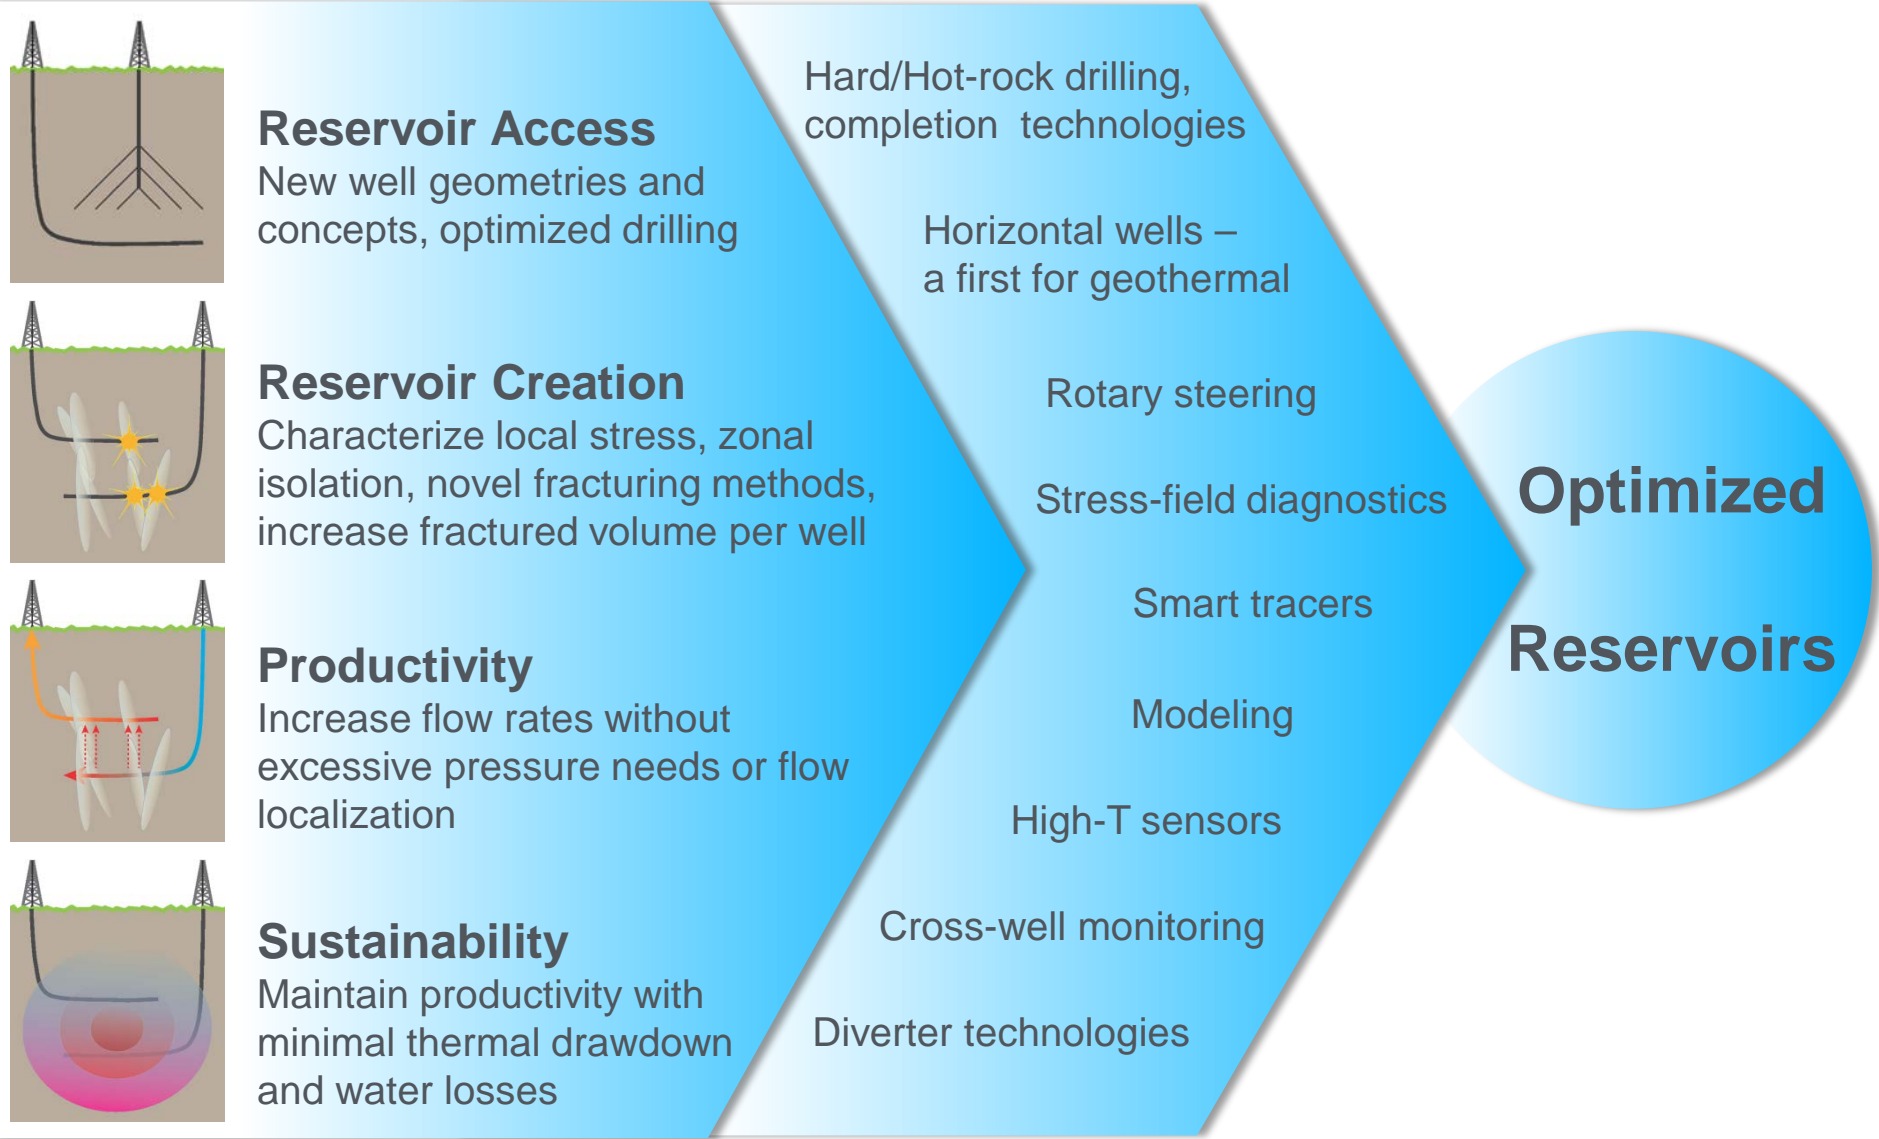

### Initial activity planned FY14-FY15

- Private sector cannot / will not take on risk or costs alone
- Pathway to achieving 100+ GWe potential

# Key Barriers to EGS Development

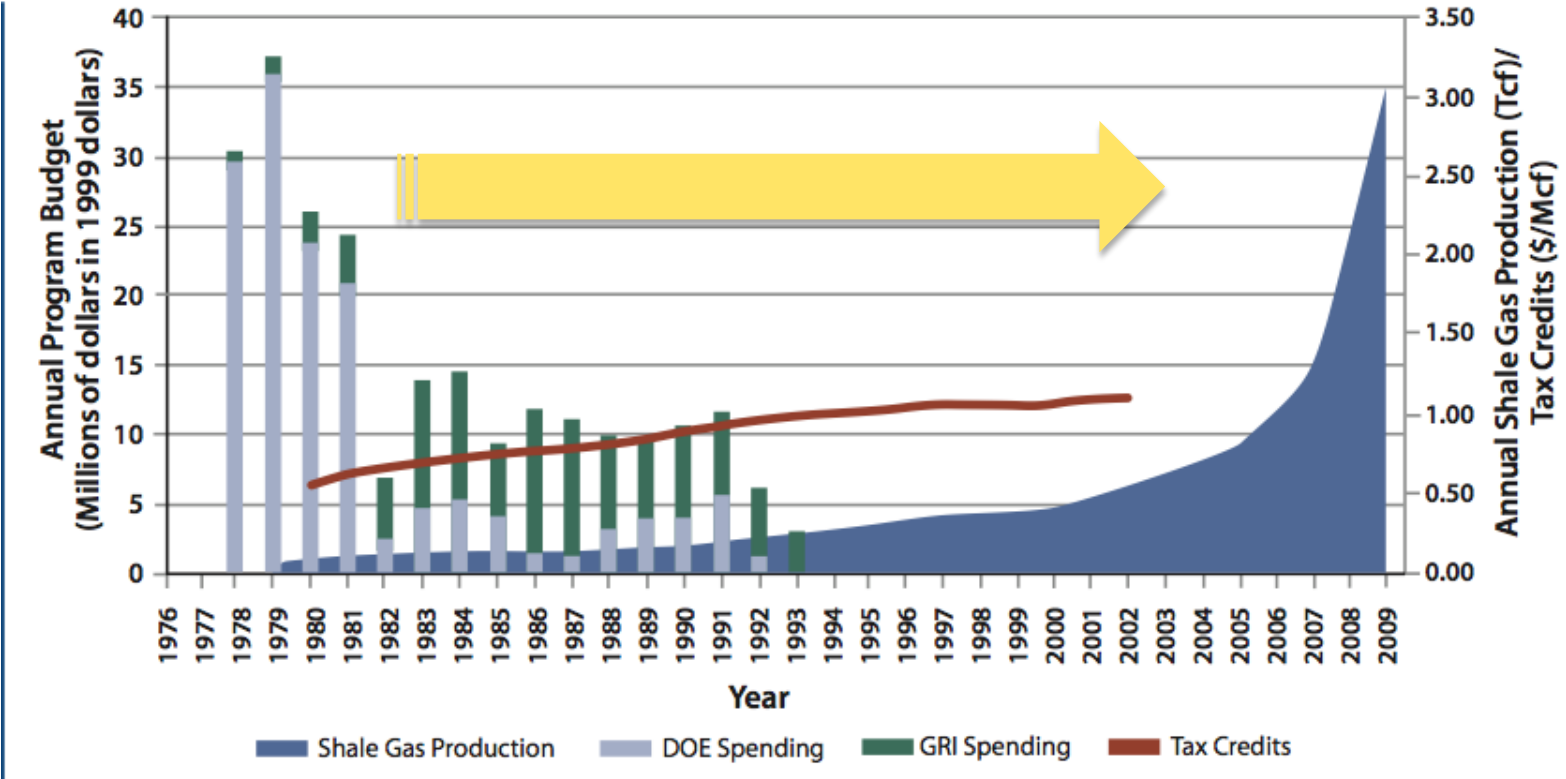

## Technology and Engineering Needs

*Over 25 years of government and private investment in shale gas RD&D and supporting policy mechanisms were necessary to have a “material impact”\**

***Will similar investment in enhanced geothermal techniques have a similar impact?***

**Figure 8.2 Shale Gas RD&D Spending and Supporting Policy Mechanisms**

\* from the MIT report titled, *The Future of Natural Gas*, available at <http://web.mit.edu/mitei/research/studies/natural-gas-2011.shtml> c

## Where are we going in batteries

Nickel Metal Hydrides and Li ion batteries are the mainstream.

What about--

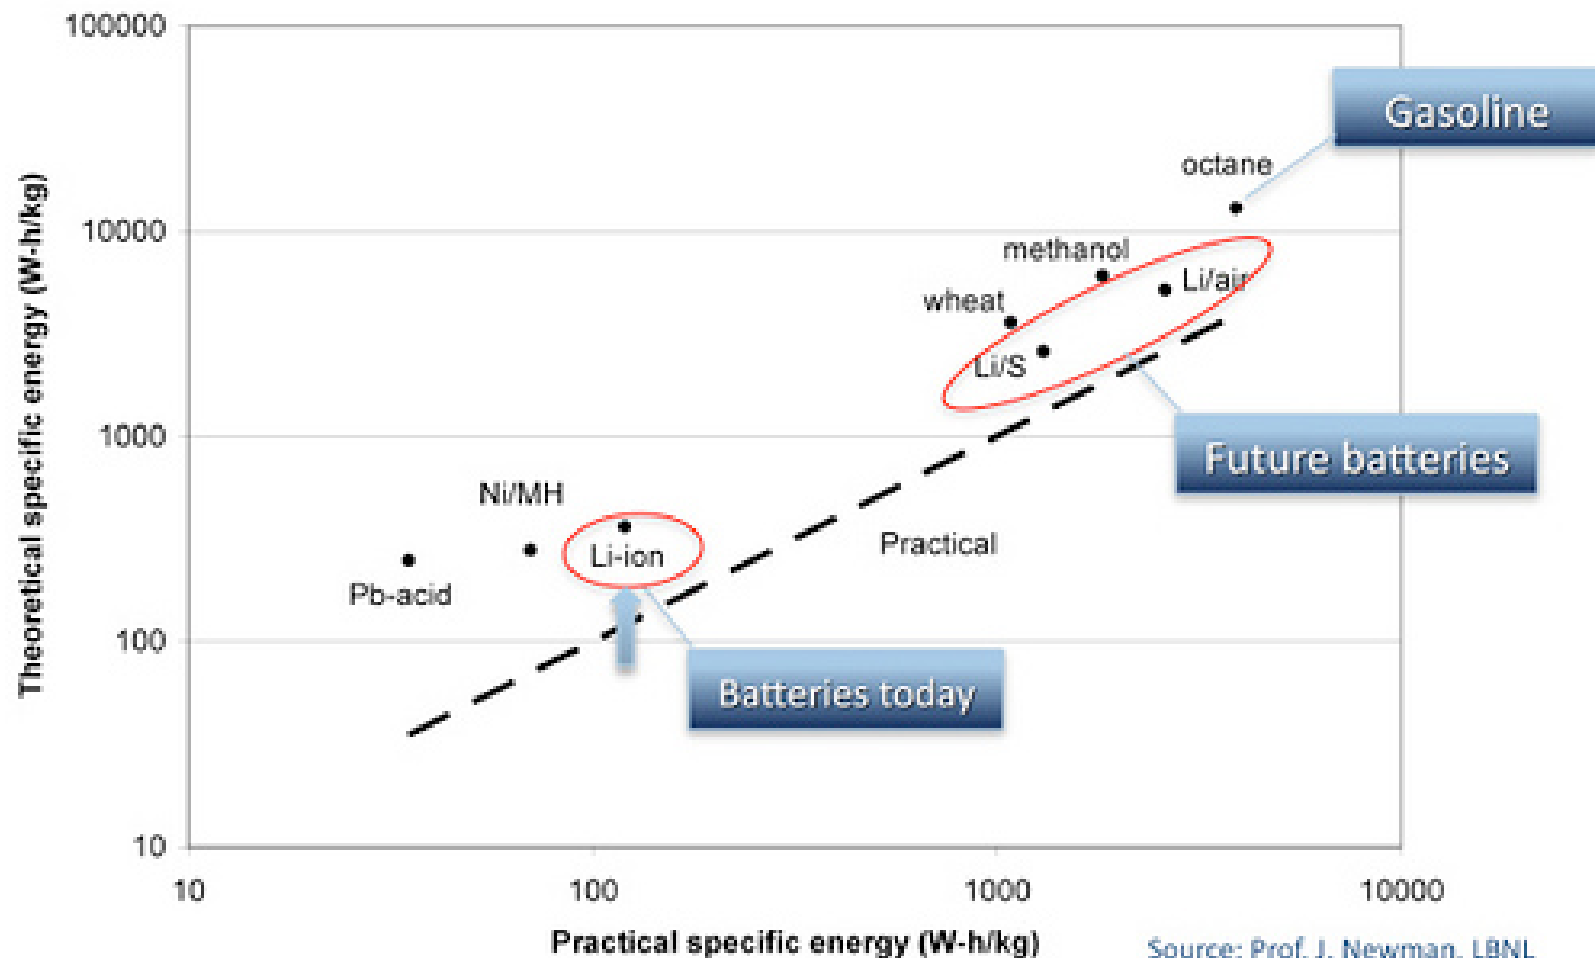

Graphite-silicon or tin?

Li-S?

Li-Air?

Na batteries?

# Energy Density Goals

Source: Prof. J. Newman, LBNL

# Scalable, High Power Charge Storage with Carbon Slurries

## Scientific Achievement

Discovered that carbon slurries can store electrical energy in electric double layers just like supercapacitors.

## Significance and Impact

Capacitive carbon slurries can flow, enabling a new type of electrochemical storage device called the electrochemical flow capacitor (EFC), which combines the high power of supercapacitors with the scalable energy capacity of flow batteries.

**a:** Schematic showing charged and discharged slurries stored in separate containers which are scalable to the energy requirements of the system.

**b:** A charge/discharge EFC cell used for charging flowing slurry.

Presser, V. et al. *Advanced Energy Materials* 2012, 2, 895-902.

**ENERGY**

Office of  
Science

# Batteries and Energy Storage Innovation Hub

*Joint Center for Energy Storage Research  
Argonne National lab lead  
selection announced on Nov. 30*

- JCESR aggressive “5/5/5” goal: 5 times the energy density, 1/5 the cost, in 5 years.

**4 National Labs:** Lawrence Berkeley National Laboratory, Pacific Northwest National Laboratory, Sandia National Laboratories, SLAC National : Accelerator Laboratory.

**5 Universities:** Northwestern University, University of Chicago, University of Illinois-Chicago & Urbana-Champaign University of Michigan.

**Four Industrial Partners:** Dow Chemical Company, Applied Materials, Inc., Johnson Controls, Inc., Clean Energy Trust.

U.S. DEPARTMENT OF  
**ENERGY**

Office of  
Science

## Where to go with Carbon Capture and Storage?

How can we capture and reuse carbon dioxide at an affordable cost?

# Carbon Capture and Sequestration

Two scenarios for reducing carbon dioxide emissions to keep atmospheric concentrations at 450-750 ppmv. Left: high-emission scenario, where nuclear plays an important role. Right low-emission scenario. In both cases, carbon capture and storage (CCS) – the orange wedge - plays a critical role. (IPCC report, 2007)

- Continued use of fossil fuel while capping the atmospheric concentration of carbon dioxide to about double the pre-industrial level requires the sequestration of ~10 GT of CO<sub>2</sub> per year.
- Current technologies for the post-combustion capture of CO<sub>2</sub> are too expensive.

# DOE Fossil Energy Program Carbon Capture Goals

Capture 90% of fossil-fuel generated CO<sub>2</sub> from a power plant, increasing cost of electricity by no more than 35%

(comparing to an identical plant without carbon capture)

**Big Bend Coal Power Station, Apollo Beach, FL**

*Research and Development Goals for CO<sub>2</sub> Capture Technology, National Energy Technology Laboratory, DOE, December 2011*

# Promising Membrane Technology for Carbon Capture

Membrane Technology  
and Research Inc. (MTR)  
Polaris™ membrane  
system

## DOE National Carbon Capture Center (NCCC)

a MTR membrane system will be tested  
at the NCCC in early 2013, processing 20  
tons of flue gas per day

# Coordination example: gas separations EFRC at UC Berkeley / LBL

New materials such as metal organic frameworks (MOFs, right) and ionic liquids are the focus of intense basic & applied research

## BES / EFRC Basic Science Advances

- New MOF chemistry and functionalization of ligands
- Computational modeling of new structures and prediction of separation properties
- Improved cross-cutting characterization techniques

## ARPA-E High Throughput Methodology

- High throughput (HT) MOF fabrication
- HT NMR as a pore size screening technique
- HT gas sorption measurements
- MOF life-cycle analysis
- Industrial process simulations

## FE / NETL Advanced Development

- MOF testing under realistic flue gas conditions
- Fabrication of mixed-matrix membranes based on MOFs
- MOFs for oxygen separation
- Application of chemical informatic models to prediction of ionic liquid properties

# Use of CO<sub>2</sub> for Enhanced Oil Recovery

Using CO<sub>2</sub> from power plant effluents to recover more oil could partially offset the cost of carbon capture.

CO<sub>2</sub> could be stored in reservoir after enhanced oil recovery is completed.

*Carbon Dioxide Enhanced Oil Recovery: Untapped Domestic Energy Supply and Long Term Carbon Storage Solution*  
National Energy Technology Laboratory, DOE, 2010

## Major CO<sub>2</sub> Pipelines Exist in West Texas

Over 3,000 miles of large diameter CO<sub>2</sub> pipelines have been installed in the Permian Basin of West Texas linking CO<sub>2</sub> supplies with oil fields.

The large volume (30-inch), long distance (502-mile) Cortez Pipeline from McElmo Dome to Denver City was constructed by Shell Oil in the early 1980s. It has a throughput capacity of 1.3 Bcfd (25 MMmt/yr.)

U.S. DEPARTMENT OF  
**ENERGY**

Office of  
Science

**Nuclear Power**  
**Can we depend on it?**

**Maybe a new approach??**  
**Small modular reactors?**

# The Case for Small Modular Reactors

**Small Modular Reactors (SMRs):** < 300 megawatts have several potential advantages:

- **Low technical risk** with designs based on the conventional low-enriched uranium LWR fuel cycle
- **Established licensing process**
- **More robust decay heat removal via passive cooling:**
- **Integration of “primary system”** (steam generator, pumps, etc.) within reactor vessel limits failure modes
- **Below-grade construction** hardens reactor to external hazards
- **Lower financial resources –economy of scale**
- **Intended to meet existing domestic and international (IAEA) norms** for nuclear material safeguards, spent nuclear fuel standards, and proliferation concerns

**Babcock & Wilcox mPower reactor**

Ultimate goal is construction  
in a factory setting to  
achieve economies of scale

## Nuclear Fusion

- **Can the promise of fusion be realized as an energy source?**
- **How soon and at what cost can we achieve net energy production?**

# Fusion Overview

- **Fuel**

- Plentiful and inexpensive

**Deuterium:** plentiful in the oceans

**Tritium:** produced from Lithium

- **Safety**

- No possible runaway scenario or meltdown
- No proliferation issues

- **No long lived waste products**

- Neutron induced activation (low radio toxicity < 100 years)

**Gravitational confinement**

**Magnetic Confinement**

**Inertial Confinement**

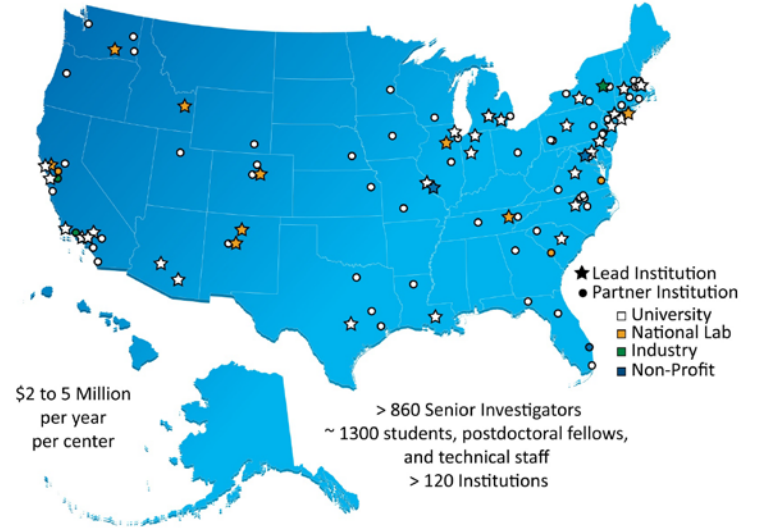

# Basic and Applied Energy Research

## 3 Biofuel Research Centers

46 EFRCs in 35 States + D.C.

## 5 Energy Innovation Hubs

## ARPA-E
